 Handbook for the Undergraduate Mathematics Courses
 Supplement to the Handbook
 Honour School of Mathematics
 Syllabus and Synopses for Part B 2006–7
 for examination in 2007

Contents

1 Foreword	4
1.1 Honour School of Mathematics	4
1.2 Honour School of Mathematics & Philosophy	5
1.3 “Units” and “half-units” and methods of examination	5
1.4 Part C (M–Level) courses available in the third year	6
 2 Mathematics Department units and half-units	 7
2.1 B1: Logic and Set Theory	7
2.1.1 B1a: Logic — Prof Wilkie — 16 MT	7
2.1.2 B1b: Set Theory — Dr Knight — 16 HT	8
2.2 B2: Algebra	9
2.2.1 B2a: Algebras — Dr Erdmann — 16 MT	9
2.2.2 B2b: Finite Groups and Characters— Dr Neumann — 16 HT	10
2.3 B3: Geometry	10
2.3.1 B3a: Geometry of Surfaces – Prof Hitchin – 16 MT	11
2.3.2 B3b: Algebraic Curves — Dr Dancer — 16 HT	12
2.4 B4: Analysis	13
2.4.1 B4a: Analysis I — Dr Edwards — 16 MT	13
2.4.2 B4b: Analysis II — Prof Joyce — 16 HT	14
2.5 B568 Introduction to applied mathematics	14
2.6 B5 Applied Analysis	15

2.6.1	B5a: Techniques of Applied Mathematics — Dr Fowler — 16 MT . . .	15
2.6.2	B5b: Applied Partial Differential Equations — Dr Norbury — 16 HT . . .	16
2.7	B6 Theoretical Mechanics	17
2.7.1	B6a: Viscous Flow — Dr H Ockendon — 16 MT	17
2.7.2	B6b: Waves and Compressible Flow — Dr Howell — 16 HT	18
2.8	B7.1/C7.1: Quantum Mechanics and Quantum Theory and Quantum Computers	19
2.8.1	B7.1a: Quantum Mechanics — Dr Hannabuss — 16 MT	19
2.8.2	C7.1b: Quantum Theory and Quantum Computers — Dr Hannabuss — 16HT — M-Level	20
2.9	B7.2/C7.2: Relativity	21
2.9.1	B7.2a: Special Relativity and Electromagnetism – Prof Mason – 16 MT	22
2.9.2	C7.2b: General Relativity — Dr A Hodges — 16HT — M-Level	23
2.10	B8 Topics in Applied Mathematics	25
2.10.1	B8a: Mathematical Ecology and Biology — Dr Gaffney — 16 MT	25
2.10.2	B8b: Nonlinear Systems — Dr Moroz — 16 HT	26
2.11	B9: Number Theory	27
2.11.1	B9a: Polynomial Rings and Galois Theory —Dr Szendroi — 16 MT	27
2.11.2	B9b: Algebraic Number Theory — Prof Heath-Brown — 16 HT	28
2.12	B10: Martingales and Financial Mathematics	29
2.12.1	B10a: Martingales Through Measure Theory — Dr Kristensen — 16 MT	29
2.12.2	B10b: Mathematical Models of Financial Derivatives — Dr Hambly — 16 HT	30
2.13	B11: Communication Theory — Dr Stirzaker — 16 MT	31
2.14	B21 Numerical Solution of Differential Equations	32
2.14.1	B21a Numerical Solution of Differential Equations I — Prof Süli — 16 MT	32
2.14.2	B21b Numerical Solution of Differential Equations II — Dr Sobey — 16 HT	33
2.15	B22 Integer Programming — Dr Hauser — 16 MT	34
2.16	C3.1: Geometry: Topology and Groups and Algebraic Topology	35
2.16.1	C3.1a: Topology and Groups – Dr Lackenby – 16 MT — M-Level	35
2.16.2	C3.1b: Algebraic Topology — Prof Tillmann — 16 HT — M-Level	37

2.17	C5.1a: Partial Differential Equations for Pure and Applied Mathematicians (M-level)— Dr Dyson — 16MT	38
2.18	C9.1a: Analytic Number Theory — Prof Heath-Brown — 16MT — M-Level	40
2.19	BE “Mathematical” Extended Essay	41
3	Other Mathematical units and half-units	41
3.1	O1: History of Mathematics — Dr Flood, Dr Neumann, Dr Stedall and Dr Wilson — 16 MT and 8 HT	41
3.2	OBS1: Applied Statistics	43
3.3	OBS2a: Statistical Inference – Lecturer TBC — 16MT	44
3.4	OBS3: Stochastic Modelling	45
3.4.1	OBS3a: Applied Probability – Dr Winkel – 16 MT	45
3.4.2	OBS3b: Statistical Lifetime-Models – lecturer TBC – 16 HT	46
3.5	OBS4: Actuarial Science	48
3.5.1	OBS4a: Actuarial Science I – Dr Martin – 16 MT	48
3.5.2	OBS4b: Actuarial Science II – Mr Daniel Clarke – 16 HT	49
3.6	OCS1: Functional Programming and Data Structures and Algorithms	49
3.6.1	OCS1a: Functional Programming — Prof Bird — 16 MT	49
3.6.2	OCS1b: Data Structures and Algorithms — Prof Ong — 16 HT	51
3.7	OCS2a: Logic of Multi Agent Information Flow — Dr Baltag — 16 MT	52
3.8	OCS3a Lambda Calculus & Types — Dr Ker — 16 MT	55
3.9	OE “Other Mathematical” Extended Essay	57
4	Non-Mathematical units and half-units	57
4.1	N1 Undergraduate Ambassadors’ Scheme — mainly HT	57
4.2	N101 History of Philosophy from Descartes to Kant — Varios lecturers — 24MT, 16HT and 8TT	59
4.3	N102 Knowledge and Reality — Prof J. Hawthorne and Dr G. Uzquiano Cruz — 8MT and 8HT	59
4.4	N122 Philosophy of Mathematics — Dr A. Paseau — 16MT	59
5	Language Classes	60
6	Registration for Part B courses 2006–07	64

1 Foreword

See the current edition of the *Examination Regulations* for the full regulations governing these examinations.

1.1 Honour School of Mathematics

In Part B each candidate shall offer a total of four units from the schedule of units and half-units.

(a) A total of at least three units offered should be from the schedule of 'Mathematics Department units and half-units'

(b) Candidates may offer at most one unit which is designated as an Extended Essay¹

Details of units for Part C will be published in 2007. Students staying on to take the four-year course will take 3 units from Part C in their fourth year.

In the classification awarded at the end of the third year, unit paper marks in Part A will be given a 'weighting' of 2, and unit paper marks in Part B will be given a 'weighting' of 3.

For those students staying on to do the fourth year, a separate class will be awarded on the basis of the Part C marks.

YOU MUST REGISTER BY THE END OF TRINITY TERM 2006 FOR LECTURE AND CLASS ATTENDANCE FOR ALL COURSES YOU WISH TO TAKE IN 2006-07. A REGISTRATION FORM IS ATTACHED TO THESE SYNOPSES.

SOME COMBINATIONS OF SUBJECTS ARE NOT ADVISED AND LECTURES IN THESE SUBJECTS MAY CLASH. HOWEVER, WHEN TIMETABLING LECTURES WE WILL AIM TO KEEP CLASHES TO A MINIMUM. WE WILL USE THE INFORMATION ON YOUR REGISTRATION FORMS TO PLAN CLASS TEACHING AND LECTURING. IT IS THEREFORE IMPORTANT THAT YOU RETURN YOUR REGISTRATION FORM BY MONDAY, WEEK 9, TRINITY TERM 2006. IF YOU NEED TO CHANGE YOUR REGISTRATIONS AFTER THAT DATE, PLEASE INFORM THE ACADEMIC ASSISTANT AS SOON AS POSSIBLE.

Language Classes Mathematics and Mathematics & Statistics students are also invited to apply to take classes in a foreign language. In 2006-07 classes are offered in French. Students' performance in these classes will not contribute to the degree classification in Mathematics. However, successful completion of the course may be recorded on student transcripts. See section 6 for more details.

¹Units which may be offered under this heading are indicated in the synopses.

1.2 Honour School of Mathematics & Philosophy

In Part B each candidate shall offer the following

(i) A total of at least two units in Mathematics from the schedule of ‘Mathematics Department Units’ as specified in this handbook, to include B1 Foundations: Logic and Set Theory. In addition, candidates are permitted to offer O1 History of Mathematics as specified from the list of ‘Other Mathematical Units’ in this handbook, so long as they offer a total of three units in Mathematics.

(ii) At least three subjects in *Philosophy* from subjects 101-18, 120-2 or 199 Thesis as prescribed in the Regulations of Philosophy in all Honour Schools including Philosophy, of which two must be subjects 102 and 122.

(iii) The total number of units and subjects together should be six.

Foundations (B1) is normally taken in the second year.

YOU MUST REGISTER BY THE END OF TRINITY TERM 2006 FOR LECTURE AND CLASS ATTENDANCE FOR ALL COURSES YOU WISH TO TAKE IN 2006-07. A REGISTRATION FORM IS ATTACHED TO THESE SYNOPSES.

SOME COMBINATIONS OF SUBJECTS ARE NOT ADVISED AND LECTURES IN THESE SUBJECTS MAY CLASH. HOWEVER, WHEN TIMETABLING LECTURES WE WILL AIM TO KEEP CLASHES TO A MINIMUM. WE WILL USE THE INFORMATION ON YOUR REGISTRATION FORMS TO PLAN CLASS TEACHING AND LECTURING. IT IS THEREFORE IMPORTANT THAT YOU RETURN YOUR REGISTRATION FORM BY MONDAY, WEEK 9, TRINITY TERM 2006. IF YOU NEED TO CHANGE YOUR REGISTRATIONS AFTER THAT DATE, PLEASE INFORM THE ACADEMIC ASSISTANT AS SOON AS POSSIBLE.

1.3 “Units” and “half-units” and methods of examination

Most subjects offered have a ‘weight’ of one unit, and will be examined in a 3-hour examination paper. In many of these subjects it will also be possible to take the first half, or either half, of the subject as a ‘half-unit’. Where this is the case, a half-unit will usually be examined in an examination paper of $1\frac{3}{4}$ -hours.

Rubrics on 3-hour examination papers

The rubric on 3-hour examination papers will usually be: “Submit answers to a maximum of five questions. Submit at least one answer in each section (half-unit) of the paper. The best answer in each section will count, along with the two best of the remaining answers”.

Rubrics on $1\frac{3}{4}$ -hour examination papers

The rubric on $1\frac{3}{4}$ -hour examination papers will usually be: “Submit answers to a maximum of three questions. The best two answers will be counted”.

All Computer Science options will be examined by a paper of $1\frac{1}{2}$ hours in length.

1.4 Part C (M-Level) courses available in the third year

All Part C courses (marked as 'M-Level') available to third year students will be examined using the same examination questions/projects - as used for fourth-year students. The courses Topology and Groups, Algebraic Topology and Analytic Number Theory will not be available in the fourth year; instead there will be courses on Lie Groups, Differentiable Manifolds, and Introduction to Modular Forms.

2 Mathematics Department units and half-units

2.1 B1: Logic and Set Theory

NB: This course is ‘Foundations’ in the Honour School of Mathematics & Philosophy, where it should usually be taken in the second year.

Level: H-level **Method of Assessment:** 3-hour or $1\frac{3}{4}$ -hour examination

Weight: One unit, or can be taken as either a half-unit in Logic or a half-unit in Set Theory.

2.1.1 B1a: Logic — Prof Wilkie — 16 MT

[Option **B1a** if taken as a half-unit.]

Aims & Objectives To give a rigorous mathematical treatment of the fundamental ideas and results of logic that is suitable for the non-specialist mathematicians and will provide a sound basis for more advanced study. Cohesion is achieved by focusing on the Completeness Theorems and the relationship between probability and truth. Consideration of some implications of the Compactness Theorem gives a flavour of the further development of model theory. To give a concrete deductive system for predicate calculus and prove the Completeness Theorem, including easy applications in basic model theory.

Synopsis The notation, meaning and use of propositional and predicate calculus. The formal language of propositional calculus: truth functions; conjunctive and disjunctive normal form; tautologies and logical consequence. The formal language of predicate calculus: satisfaction, truth, validity, logical consequence.

Deductive system for propositional calculus: proofs and theorems, proofs from hypotheses, the Deduction Theorem; Soundness Theorem. Maximal consistent sets of formulae; completeness; constructive proof of completeness.

Statement of Soundness and Completeness Theorems for a deductive system for predicate calculus; derivation of the Compactness Theorem; simple applications of the Compactness Theorem.

A deductive system for predicate calculus; proofs and theorems; prenex form. Proof of Completeness Theorem. Existence of countable models, the downward Löwenheim-Skolem Theorem.

4. D Goldrei, *Propositional and Predicate Calculus: A model of argument*, Springer (2005)

Further Reading

1. R Cori and D Lascar, *Mathematical Logic: A Course with Exercises (Part II)* Oxford University Press (2001), section 8.

2.1.2 B1b: Set Theory — Dr Knight — 16 HT

[Option **B1b** if taken as a half-unit.]

Aims & Objectives To introduce sets and their properties as a unified way of treating mathematical structures, including encoding of basic mathematical objects using set theoretic language. To emphasize the difference between intuitive collections and formal sets. To introduce and discuss the notion of the infinite, the ordinals and cardinality. To consider the Axiom of Choice and its implications.

Synopsis What is a set? Introduction to the basic axioms of set theory. Ordered pairs, cartesian products, relations and functions. Axiom of Infinity and the construction of the natural numbers; induction and the recursion theorem.

Cardinality; the notions of finite and countable and uncountable sets; Cantor's Theorem on power sets. The Tarski Fixed Point theorem. The Schröder-Bernstein Theorem.

Isomorphism of ordered sets; well-orders. Transfinite induction; transfinite recursion [informal treatment only].

Comparability of well-orders.

The Axiom of Choice, Zorn's Lemma, the Well-ordering Principle; comparability of cardinals. [The proofs that (WO) implies (AC); (ZL) implies (AC); (ZL) implies (CC) are included; brief discussion will also be given of the method of proof of additional implications, sufficient to establish equivalence.] Ordinals. Arithmetic of cardinals and ordinals [the proof that, in [ZFC], $\kappa \cdot \kappa = \kappa$ for an infinite cardinal κ is excluded].

Reading

2. W B Enderton, *Elements of Set Theory*, Academic Press (1978)

Further Reading

1. R Cori and D Lascar, *Mathematical Logic: A Course with Exercises (Part II)* Oxford University Press (2001), section 7.1–7.5.

2.2 B2: Algebra

Level: H-level

Method of Assessment: 3-hour examination

Prerequisites: All second-year algebra.

Weight: One Unit

Aims & Objectives The intention is to present an integrated unit. The first half extends some of the general ideas, studied before separately for groups and particular commutative rings, to a more unified setting. This leads on to basic study of representation theory as a generalisation of the permutation representations of groups studied in the second year; modules are introduced, and they are studied in the context of representations of semisimple algebras and of modules over Euclidean domains.

The second half specialises to the study of finite groups and their characters, using the results of the first half, and culminating in the one classical application of character theory, Frobenius' theorem, that to this day has not yielded to a purely group theoretic proof.

2.2.1 B2a: Algebras — Dr Erdmann — 16 MT

Synopses Noncommutative rings, one- and two-sided ideals. Associative algebras (over fields). Main examples matrix algebras, polynomial rings and quotients of polynomial rings. Group algebras, representations of groups, with examples coming from permutation actions.

Modules, relationship with representations. Finite dimensional modules over algebras; irreducible (simple) and indecomposable modules, composition series, Jordan-Hölder theorem. Semisimple algebras and their representations; the Wedderburn theorem, Maschke's theorem and the 'classification' of all representations in terms of simple modules.

Modules over Euclidean domains; cyclic decomposition for finitely generated modules. Application to finitely generated abelian groups and canonical forms for linear transformations (Jordan form, rational canonical form).

[Lectures split 4+6 +6]

Reading

1. P M Cohn, *Algebra*. 2nd edition, Chichester : Wiley (1982-1991). Parts I and II contain much of the course.

For the last part:

1. B Hartley and T O Hawkes, *Rings, Modules and Linear Algebra* London : Chapman & Hall (1970).
2. M E Keating, *A first course in module theory* London : Imperial College Press (c1998).

2.2.2 B2b: Finite Groups and Characters— Dr Neumann — 16 HT

Synopses Some classic theorems of finite group theory: Cauchy’s Theorem, Sylow’s Theorems, the Jordan–Hölder Theorem.

Simplicity of alternating groups for degree not 4. Soluble groups and their characterisation by composition factors. Semidirect products. The groups of small orders.

Complex representations of a finite group, Maschke’s Theorem, simple modules and Schur’s Lemma, analysis of the regular representation module. Characters of a finite group. Orthogonality of irreducible characters. Character tables. Characters of permutation representations. Examples.

Induced representations and characters; the Frobenius Reciprocity Theorem. Frobenius groups; easy examples as semidirect products. Frobenius’ theorem that all Frobenius groups are semidirect products.

Reading Almost everything is covered by:

J I Alperin and Rowen B Bell, *Groups and representations*, Springer-Verlag (GTM 162) 1995; ISBN 0-387-94526-1.

Alternative reading:

Joseph J Rotman, *An introduction to the theory of groups* (4th edition), Springer-Verlag (GTM 148) 1995; ISBN 3-540-94285-8; Ch 4, and parts of Chapters 3, 5, 7.

Gordon James and Martin Liebeck, *Representations and characters of finite groups*, (2nd edition), CUP 2001; ISBN 0-521-00392-X.

W Ledermann, *Introduction to group theory*, Longman (Oliver & Boyd) 1973; ISBN 0-582-44180-3.

W Ledermann, *Introduction to group characters*, CUP 1977; ISBN 0-521-29170-4.

2.3 B3: Geometry

Level: H-level

Method of Assessment: 3-hour or $1\frac{3}{4}$ -hour examination

Weight: One unit, or can be taken as either a half-unit in Geometry of Surfaces or a half-unit in Algebraic Curves (but see “Prerequisites”).

Prerequisites: 2nd year core algebra and analysis, 2nd year topology. Multivariable calculus and groups in action would be useful but not essential. Also, Part I is helpful, but not essential, for Part II.

2.3.1 B3a: Geometry of Surfaces – Prof Hitchin – 16 MT

[Option B3a if taken as a half-unit.]

Aims and Objectives Different ways of thinking about surfaces (also called two-dimensional manifolds) are introduced in this course: first topological surfaces and then surfaces with extra structures which allow us to make sense of differentiable functions ('smooth surfaces'), holomorphic functions ('Riemann surfaces') and the measurement of lengths and areas ('Riemannian 2-manifolds').

These geometric structures interact in a fundamental way with the topology of the surfaces. A striking example of this is given by the Euler number, which is a manifestly topological quantity, but can be related to the total curvature, which at first glance depends on the geometry of the surface.

The course ends with an introduction to hyperbolic surfaces modelled on the hyperbolic plane, which gives us an example of a non-Euclidean geometry (that is, a geometry which meets all Euclid's axioms except the axioms of parallels).

Learning outcomes The candidate will be able to implement the classification of surfaces for simple constructions of topological surfaces such as planar models and connected sums; be able to relate the Euler characteristic to branching data for simple maps of Riemann surfaces; understand the definition and use of Gaussian curvature; know the geodesics and isometries of the hyperbolic plane and their use in geometrical constructions.

Synopsis The concept of a topological surface (or 2-manifold); examples, including polygons with pairs of sides identified. Orientation and the Euler characteristic. Classification theorem for compact surfaces (the proof will not be examined).

Riemann surfaces; examples, including the Riemann sphere, the quotient of the complex numbers by a lattice, and double coverings of the Riemann sphere. Holomorphic maps of Riemann surfaces and the Riemann-Hurwitz formula.

Smooth surfaces in Euclidean three-space and their first fundamental forms. The concept of a Riemannian 2-manifold; isometries; Gaussian curvature.

Geodesics. The Gauss-Bonnet Theorem (statement of local version and deduction of global version). Critical points of real-valued functions on compact surfaces.

The hyperbolic plane, its isometries and geodesics. Compact hyperbolic surfaces as Riemann surfaces and as surfaces of constant negative curvature.

Reading

2. GB Segal, *Geometry of Surfaces*, Mathematical Institute Notes (1989)
3. R Earl, *The Local Theory of Curves and Surfaces*, Mathematical Institute Notes (1999)

4. J McCleary, *Geometry from a Differentiable Viewpoint*, Cambridge 1997.

Further Reading

1. PA Firby and CE Gardiner, *Surface Topology*, Ellis Horwood 1991 (Chapters 1-4 and 7)
2. F Kirwan, *Complex Algebraic Curves*, London Mathematical Society Student Texts 23, Cambridge 1992 (Chapter 5.2 only)
3. B O'Neill, *Elementary Differential Geometry*, Academic Press 1997.

2.3.2 B3b: Algebraic Curves — Dr Dancer — 16 HT

[Option **B3b** if taken as a half-unit.]

Aims and Objectives A real algebraic curve in the plane \mathbb{R}^2 is a subset of \mathbb{R}^2 defined by a polynomial equation $P(x, y) = 0$; a complex algebraic curve is defined similarly with \mathbb{C} instead of \mathbb{R} . Real algebraic curves have been studied for more than two thousand years, although it was not until the introduction of the systematic use of coordinates into geometry in the seventeenth century that they could be described in the form $\{(x, y) \in \mathbb{R}^2 : P(x, y) = 0\}$. Once complex numbers were recognised as acceptable mathematical objects it quickly became clear that complex algebraic curves have at once simpler and more interesting properties than real algebraic curves. In this course algebraic curves over \mathbb{C} (or more generally over any algebraically closed field of characteristic 0) are studied, using ideas from algebra, from topology and from complex analysis.

Learning outcomes Students will see the concepts of projective space and curves in the projective plane. They will understand the notion of nonsingularity, learn some basic intersection theory (Bezout's theorem), and see the degree-genus formula for smooth curves. They will see the concept of Riemann surface, the Riemann-Roch theorem, and a detailed study via Weierstrass functions of the equivalence between smooth cubics and genus one Riemann surfaces.

Synopsis Projective spaces, homogeneous and inhomogeneous coordinates, projective transformations (all over an algebraically closed field k of characteristic 0).

Algebraic curves in the affine plane. Projective curves in $\mathbb{C}\mathbb{P}^2$. Points at infinity. Euler's relation. Irreducible components. Singular and nonsingular points, tangent lines.

Bezout's theorem for curves which intersect transversely (the proof will not be examined), with informal discussion of intersection multiplicities. Pascal's mystic hexagon. Points of inflection.

Branched covers of $\mathbb{C}\mathbb{P}^1$. The degree-genus formula.

Holomorphic differentials on a nonsingular curve. Divisors and degrees. Canonical divisors. Statement of the Riemann-Roch Theorem. Geometric genus equals topological genus.

Elliptic curves. The Weierstrass \wp -function and the cubic curve associated to a lattice. The group law on a nonsingular cubic.

Reading

1. F Kirwan, *Complex Algebraic Curves*, LMS Student Texts 23, Cambridge 1992, Chapters 2-6.

2.4 B4: Analysis

Level: H-level

Method of Assessment: 3-hour or $1\frac{3}{4}$ -hour examination

Prerequisites: For the first half of B4, Part A Topology is desirable and Integration is useful.

For the whole unit, Topology is desirable and Integration is desirable.

Weight: One unit, or the Michaelmas Term course may be taken alone as a half-unit.

Learning outcomes The two most important kinds of infinite-dimensional vector space are Banach spaces and Hilbert spaces; they provide the theoretical underpinnings for much of differential equations, and also for quantum theory in physics. This course provides an introduction to Banach spaces and Hilbert spaces. It combines familiar ideas from topology and linear algebra. It would be useful background for further work in analysis, differential equations, and so on.

The learning outcomes are an appreciation and understanding of topics listed in the syllabus below.

2.4.1 B4a: Analysis I — Dr Edwards — 16 MT

[Option **B4a** if taken as a half-unit.]

Synopses Real and complex normed vector spaces, their geometry and topology. Completeness. Banach spaces, examples (ℓ^p , ℓ^∞ , L^p , $C(K)$, spaces of differentiable functions).

Finite-dimensional normed spaces; equivalence of norms and completeness. Separable spaces; separability of subspaces.

Continuous linear functionals. Dual spaces. Hahn-Banach Theorem (proof for real separable spaces only) and applications including density of subspaces.

Bounded linear operators, examples (including integral operators). Adjoint operators. Spectrum and resolvent. Spectral mapping theorem for polynomials.

Reading

Essential

Further

1. G.F. Vincent-Smith, *B4: Analysis, Mathematical Institute Notes (1991)*, Chs 1, 2, 5.2

2.4.2 B4b: Analysis II — Prof Joyce — 16 HT

Synopses Hilbert spaces; examples including L^2 spaces. Orthogonality, orthogonal complement, closed subspaces, projection theorem. Riesz Representation Theorem.

Orthonormal sets, Pythagoras, Bessel's inequality. Complete orthonormal sets, Parseval.

Orthogonal expansions, examples (Legendre, Laguerre, Hermite etc.) Classical Fourier series: Riemann-Lebesgue lemma; Dirichlet kernel, pointwise convergence of Fourier series, Dini's test, Fejér's theorem, Weierstrass' approximation theorem. Completeness of trigonometric system.

Operators on Hilbert space, adjoint operators. Self-adjoint operators, orthogonal projections, unitary operators, and their spectra.

Reading

2.5 B568 Introduction to applied mathematics

In week one of Michaelmas Term, an introductory course of six lectures will be provided, which is a compulsory prerequisite for all students doing any of the courses in B5, B6 or B8. This courselet will cover basic material which is common to all these courses, and it will be assumed that students taking any of these courses have attended B568. The courses B5a, B6a and B8a will consequently contain 14 lectures, and will begin in second week. There will be one problem sheet associated with this course, and it is anticipated that written solutions will be provided. **No separate class will be scheduled.**

Synopsis Modelling and conservation laws.

Scaling and non-dimensionalisation.

Asymptotic sequences. Regular and singular perturbation methods for algebraic equations. Simple boundary layer theory.

Reading

1. S.D. Howison 2005 *Practical Applied Mathematics: Modelling, Analysis, Approximation*, CUP, Cambridge (UK). Chs. 1,2,3,13,16.

2.6 B5 Applied Analysis

Level: H-level

Method of Assessment: 3-hour or $1\frac{3}{4}$ -hour examination

Prerequisites: Calculus of Variations and Fluid Mechanics from Part A are desirable but not essential. The introductory Michaelmas Term course B568 is a prerequisite for both parts of the course, and the material in that course will be assumed known.

Weight: One unit, or can be taken as either a half-unit in Techniques of Applied Mathematics or a half-unit in Applied Partial Differential Equations.

Quota: Not imposed this year.

2.6.1 B5a: Techniques of Applied Mathematics — Dr Fowler — 16 MT

[Option **B5a** if taken as a half-unit.]

Learning outcomes This course develops mathematical techniques which are useful in solving ‘real-world’ problems involving differential equations, and is a development of ideas which arise in the second year differential equations course. The course aims to show in a practical way how equations ‘work’, what kinds of solution behaviours can occur, and some techniques which are useful in their solution.

Synopsis Nonlinear oscillations. Multiple scale methods.

Ordinary differential equations: hysteresis and stability.

Sturm-Liouville systems, comparison methods. Integral equations and eigenfunctions.

Partial differential equations: shocks, similarity solutions.

Reading

1. A.C. Fowler 2005 *Techniques of Applied Mathematics*. Mathematical Institute lecture notes.
2. J.P. Keener 2000 *Principles of Applied Mathematics: Transformation and Approximation*, revised edition. Perseus Books, Cambridge, Mass.

3. E.J. Hinch 1991 *Perturbation Methods*. CUP, Cambridge.
4. J.R. Ockendon, S. D. Howison, A.A. Lacey and A.B. Movchan 2003 *Applied Partial Differential Equations*, revised edition. OUP, Oxford.
5. R. Haberman 1998 *Mathematical Models*. SIAM, Philadelphia.
6. S.D. Howison 2005 *Practical Applied Mathematics: Modelling, Analysis, Approximation*. CUP, Cambridge (UK).

2.6.2 B5b: Applied Partial Differential Equations — Dr Norbury — 16 HT

[Option **B5b** if taken as a half-unit.]

Learning outcomes This course continues the Part A Differential Equations course, and extends some of the techniques of B5a, to partial differential equations. In particular, general nonlinear first order partial differential equations are solved, the classification of second order partial differential equations is extended to systems, with hyperbolic systems being solved by characteristic variables. Then Green's function, maximum principle and similarity variable methods are demonstrated for partial differential equations, together with eigenfunction expansions.

Synopsis Charpit's equations; eikonal equation.

Systems of partial differential equations, characteristics. Weak solutions. Riemann's function.

Maximum principles, comparison methods, well-posed problems, and Green's functions for the heat equation and for Laplace's equation.

Delta functions. Eigenfunction expansions.

2.7 B6 Theoretical Mechanics

Level: H-level

Method of Assessment: 3-hour or $1\frac{3}{4}$ -hour examination

Weight: One unit, or can be taken as either a half-unit in Viscous Flow, or a half-unit in Waves and Compressible Flow.

Prerequisites: The Part A (second-year) course ‘Fluid Dynamics and Waves’. Though each half-unit is intended to stand alone, they will complement each other. This course combines well with B5 Applied Analysis. The introductory Michaelmas Term course B568 is a prerequisite for both parts of the course, and the material in that course will be assumed known.

Quota: Not imposed this year.

2.7.1 B6a: Viscous Flow — Dr H Ockendon — 16 MT

[Option **B6a** if taken as a half-unit.]

Learning outcomes Viscous fluids are important in so many facets of everyday life that everyone has some intuition about the diverse flow phenomena that occur in practice. This course is distinctive in that it shows how quite advanced mathematical ideas such as asymptotics and partial differential equation theory can be used to analyse the underlying differential equations and hence give scientific understanding about flows of practical importance, such as air flow round wings and flow in oil reservoirs.

Learning outcomes are an appreciation and understanding of the topic described in the syllabus below.

Synopsis Derivation of Navier–Stokes equations for an incompressible Newtonian fluid. Vorticity. Energy equation and dissipation. Exact solutions for unidirectional flows; shear flow, Poiseuille flow, Rayleigh flow. Dimensional analysis, Reynolds number. Derivation of equations for high and low Reynolds number flows.

Derivation of Prandtl’s boundary-layer equations. Similarity solutions for flow past a semi-infinite flat plate and for jets. Discussion of separation and application to the theory of flight. Jeffery–Hamel flow.

Slow flow past a circular cylinder and a sphere. Non-uniformity of the two dimensional approximation; Oseen’s equation. Lubrication theory: bearings, thin films and Hele-Shaw cell. Flow in a porous medium. Stability and the transition to turbulence.

Reading

3. M.E. O’Neill and F. Chorlton, *Viscous and Compressible Fluid Dynamics*, Ellis Horwood (1989), Chs 2, 3, 4.1–4.3, 4.19–4.20, 4.22–4.24, 5.1–5.2, 5.6

2.7.2 B6b: Waves and Compressible Flow — Dr Howell — 16 HT

[Option **B6b** if taken as a half-unit.]

Learning outcomes Propagating disturbances, or waves, occur frequently in applied mathematics, especially in applied mechanics. This course will be centred on some prototypical examples from fluid dynamics, the two most familiar being surface gravity waves and waves in gases. The models for compressible flow will be derived and then analysed for small amplitude motion. This will shed light on the important phenomena of dispersion, group velocity and resonance, and the differences between supersonic and subsonic flow, as well as revealing the crucial dependence of the waves on the number of space dimensions.

Larger amplitude motion of liquids and gases will be described by incorporating nonlinear effects, and the theory of characteristics for partial differential equations will be applied to understand the shock waves associated with supersonic flight.

Synopsis 1–2 Equations of inviscid compressible flow including flow relative to rotating axes.

3–6 Models for linear wave propagation including Stokes waves, Inertial waves, Rossby waves and simple solutions.

7–10 Theories for Linear waves: Fourier Series, Fourier integrals, method of stationary phase, dispersion and group velocity. Flow past thin wings, Huyghens principle.

11–12 Nonlinear Waves: method of characteristics, simple wave flows applied to one-dimensional unsteady gas flow and shallow water theory.

13–16 Shock Waves: weak solutions, Rankine-Hugoniot relations, oblique shocks, bores and hydraulic jumps.

Reading

2.8 B7.1/C7.1: Quantum Mechanics and Quantum Theory and Quantum Computers

Level: H-level/M-level **Method of Assessment:** 3-hour or $1\frac{3}{4}$ -hour examination.

Weight: One unit. B7.1a could be taken as a free-standing half-unit but C7.1b could not.

2.8.1 B7.1a: Quantum Mechanics — Dr Hannabuss — 16 MT

[Option **B7.1a** if taken as a half-unit.]

Level: H-level

Prerequisites: Calculus of Variations. Classical Mechanics would be useful, but not essential.

Aims and Objectives Quantum theory was born out of the attempt to understand the interactions matter between radiation. It transpired that light waves can behave like streams of particles, but other particles also have wave-like properties. Although there remain deep mathematical and physical questions at the frontiers of the subject, the resulting theory encompasses not just the mechanical but also the electrical and chemical properties of matter. Many of the key components of modern technology such as transistors and lasers were developed using quantum theory, and the theory has stimulated important 20th century advances in pure mathematics in, for example, functional analysis, algebra, and differential geometry. In spite of their revolutionary impact and central importance, the basic mathematical ideas are easily accessible and provide fresh and surprising applications of the mathematical techniques encountered in other branches of mathematics.

This introductory course explores some of the consequences of this, including a treatment of the hydrogen atom.

Synopsis Generalised momenta, the Hamiltonian, Hamilton's equations of motion, Poisson brackets. De Broglie waves, the Schrödinger equation; stationary states, quantum states of a particle in a box; interpretation of the wave function, probability density and current. Boundary conditions; conservation of current, tunnelling, parity.

Expectation values of observables, eigenvalues and eigenfunctions.

The one-dimensional harmonic oscillator, higher-dimensional oscillators and normal modes.

The rotationally symmetric and general radial states of the hydrogen atom with fixed nucleus.

The mathematical structure of quantum mechanics. Commutation relations, Poisson brackets and Dirac's quantisation scheme.

Heisenberg's uncertainty principle. Creation and annihilation operators for the harmonic oscillator.

Measurements and the interpretation of quantum mechanics. Schrödinger's cat.

Angular momentum, commutation relations, spectrum and matrix representation. Orbital angular momentum, rotational symmetry and spin- $\frac{1}{2}$ particles. Application to a particle in a central potential and the hydrogen atom.

Reading:

2.8.2 C7.1b: Quantum Theory and Quantum Computers — Dr Hannabuss — 16HT — M-Level

Level: M-level

Prerequisites: B7.1a Quantum Mechanics.

Aims and Objectives This course builds directly on the first course in quantum mechanics and covers a series of important topics, particularly features of systems containing several particles. The behaviour of identical particles in quantum theory is more subtle than in classical mechanics, and an understanding of these features allows one to understand the periodic table of elements and the rigidity of matter. It also introduces a new property of entanglement linking particles which can be quite widely dispersed.

There are rarely neat solutions to problems involving several particles, so usually one needs some approximation methods. In very complicated systems, such as the molecules of gas in a container, quantum mechanical uncertainty is compounded by ignorance about other details of the system and requires tools of quantum statistical mechanics.

Two state quantum systems enable one to encode binary information in a new way which permits superpositions. This leads to a quantum theory of information processing, and by exploiting entanglement to other ideas such as quantum teleportation.

Synopsis Identical particles, symmetric and anti-symmetric states, Fermi–Dirac and Bose–Einstein statistics and atomic structure.

Heisenberg representation, interaction representation, time dependent perturbation theory and Feynman–Dyson expansion. Approximation methods, Rayleigh–Schrödinger time-independent perturbation theory and variation principles. The virial theorem. Helium.

Mixed states, density operators. The example of spin systems. Purification. Gibbs states and the KMS condition.

Entanglement. The EPR paradox, Bell’s inequalities, Aspect’s experiment. GHZ states

Quantum information processing, qubits and quantum computing. The no-cloning theorem, quantum teleportation. Quantum logic gates. Quantum operations. The quantum Fourier transform. Grover’s search algorithm.

2.9 B7.2/C7.2: Relativity

Level: H-level/M-level **Method of Assessment:** 3 hour or $1\frac{3}{4}$ hour examination.

Prerequisites: For B7.2a - Part A Electromagnetism, for C7.2b - B7.2a

Weight: One unit

B7.2a can be taken as a half-unit, but C7.2b cannot.

2.9.1 B7.2a: Special Relativity and Electromagnetism – Prof Mason – 16 MT

Level: H-level

Recommended Prerequisites: Part A Electromagnetism.

Learning outcomes Maxwell’s electromagnetic theory revealed light to be an electromagnetic phenomenon whose speed of propagation proved to be observer-independent. This discovery led to the overthrow of classical Newtonian mechanics, in which space and time were absolute, and its replacement by Special Relativity and space-time. The aim of this course is to study Einstein’s special theory of relativity, to understand space-time, and to incorporate into it Maxwell’s electrodynamics. These theories together with quantum theory are essential for an understanding of modern physics.

Synopsis Constancy of the speed of light; Lorentz transformations and the invariance of the wave operator; time dilation, length contraction and the relativistic Doppler effect; the resolution of the simple ‘paradoxes’ of relativity. Four-vectors; four-velocity and four-momentum; equivalence of mass and energy; particle collisions and four-momentum conservation; four-acceleration and four-force; the example of the constant-acceleration world-line. Contravariant and covariant vectors and tensors; index notation.

Solving Poisson’s equation and the wave-equation with sources. Derivation of Maxwell’s equations with sources from a variational principle.

Electromagnetism in four-dimensional form; the electromagnetic field tensor; the transformation law for the electric and magnetic fields; the Lorentz four-force law; the electromagnetic four-potential and the energy-momentum tensor.

2.9.2 C7.2b: General Relativity — Dr A Hodges — 16HT — M-Level

Level: M-Level

Recommended Prerequisites B7.2a: Special Relativity and Electromagnetism.

Aims and Objectives The course is intended as an elementary introduction to general relativity, its basic physical concepts of its observational implications, and the new insights that it provides into the nature of space time, and the structure of the universe. Some familiarity with special relativity and electromagnetism covered in the b7 course will be assumed. The lectures will review Newtonian gravitation, tensor calculus and continuum physics in special relativity, tensor calculus in Minkowski space, physics in curved space time and the Einstein field equations. This will suffice for an account of simple applications to planetary motion, the bending of light and the existence of black holes.

Learning outcomes This course starts by asking how the theory of gravitation can be made consistent with the special-relativistic framework. Physical considerations (the principle of equivalence, general covariance) are used to motivate and illustrate the mathematical machinery of tensor calculus. The technical development is kept as elementary as possible, emphasising the use of local inertial frames. A similar elementary motivation is given for Einstein's equations and the Schwarzschild solution. Orbits in the Schwarzschild solution are given a unified treatment which allows a simple account of the three classical tests of Einstein's theory. Finally, use of Eddington-Finkelstein coordinates shows students how the theory of black holes emerges and exposes the radical consequences of Einstein's theory for space-time structure. Cosmological solutions are not discussed.

The learning outcomes are an understanding and appreciation of the ideas and concepts described above.

Synopsis Review of Newtonian gravitation theory and problems of constructing a relativistic generalisation. Review of Special Relativity. The equivalence principle. Tensor formulation of special relativity (including general particle motion, tensor form of Maxwell's equations and the energy momentum-tensor of dust). Curved space time. Local inertial coordinates. General coordinate transformations, elements of Riemannian geometry (including connections, curvature and geodesic deviation). Mathematical formulation of General Relativity, Einstein's equations (properties of the energy-momentum tensor will be needed in the case of dust only). The Schwarzschild solution; planetary motion, the bending of light, and black holes.

Method of Examination 4 examination questions.

2.10 B8 Topics in Applied Mathematics

Level: H-level

Method of Assessment: 3-hour or $1\frac{3}{4}$ -hour examination

Prerequisites: Part A core material (especially differential equations). The introductory Michaelmas Term course B568 is a prerequisite for both parts of the course, and the material in that course will be assumed known.

Weight: One unit, or can be taken as either a half-unit in Nonlinear Systems or a half-unit in Mathematical Ecology and Biology.

Quota: Not imposed this year.

2.10.1 B8a: Mathematical Ecology and Biology — Dr Gaffney — 16 MT

[Option **B8a** if taken as a half-unit.]

Learning outcomes Mathematical Ecology and Biology introduces the applied mathematician to practical applications in an area that is growing very rapidly. The course mainly focusses on situations where continuous models are appropriate and where these may be modelled by deterministic ordinary and partial differential equations. By using particular modelling examples in ecology, chemistry, biology, physiology and epidemiology, the course demonstrates how various applied mathematical techniques, such as those describing linear stability, phase planes, singular perturbation and travelling waves, can yield important information about the behaviour of complex models.

Learning outcomes are an appreciation and understanding of the topic described in the syllabus below.

Synopsis Continuous and discrete population models for a single species, including Ludwig's 1978 insect outbreak model for spruce budworm. Harvesting and strategies for sustainable fishing. Modelling interacting populations, including the Lotka-Volterra model for predator-prey (with application to hare-lynx interactions), and Okubo's 1989 model for red-grey squirrel competition. Principle of competitive exclusion.

Michaelis-Menten model for enzyme-substrate kinetics.

The Belousov-Zhabotinskii reaction: threshold phenomena, excitable systems, wave propagation.

Biological pattern formation. Turing's model for animal coat markings. Chemotaxis models for reptilian coat patterns.

Simple models for the spread of disease. Travelling waves in a model for rabies infection.

Reading J.D. Murray *Mathematical Biology, 3rd edition, Springer-Verlag. Volume I: An Introduction (2002); Volume II: Spatial Models and Biomedical Applications (2003).*

1. Volume I: 1.1, 1.2, 1.6, 2.1-2.4, 3.1, 3.3-3.6, 3.8, 6.1-6.3, 6.5, 6.6, 8.1, 8.2, 8.4, 8.5, 10.1, 10.2, 11.1-11.5, 13.1-13.5, Appendix A.
2. Volume II: 1.6, 2, 3.1, 3.2, 5.1, 5.2, 13.1-13.4.

2.10.2 B8b: Nonlinear Systems — Dr Moroz — 16 HT

[Option **B8b** if taken as a half-unit.]

Learning outcomes This course aims to provide an introduction to the tools of dynamical systems theory, which are essential in the realistic modelling and study of many disciplines, including Mathematical Ecology and Biology, Fluid mechanics, Economics, Mechanics and Celestial Mechanics. The course will include the study of both deterministic ordinary differential equations, as well as nonlinear difference equations, drawing examples from the various areas of application, whenever possible and appropriate. The course will include the use of numerical software involving Matlab in the homework exercises.

Learning outcomes are an appreciation and understanding of the topic described in the syllabus below.

Synopsis

Bifurcations for Ordinary Differential Equations

Bifurcations for simple ordinary differential equations: saddle-node, transcritical, pitchfork, Hopf. Centre stable and unstable manifolds. Normal forms. The Hopf Bifurcation Theorem. Lyapunov functions. [6 lectures]

Bifurcations For Maps

Poincaré section and first-return maps. Brief review of multipliers, stability and periodic cycles. Elementary bifurcations of one-dimensional maps: saddle-node, transcritical, pitchfork, period-doubling. Two-dimensional maps. Hénon and Standard map. [6 lectures]

Chaos

Logistic map. Bernoulli shift map and symbolic dynamics. Smale Horseshoes. Lorenz equations. [4 lectures]

Reading

2. P.G. Drazin, *Nonlinear Systems*. C.U.P., Cambridge (1992).

2.11 B9: Number Theory

Level: H-level

Method of Assessment: 3-hour or $1\frac{3}{4}$ -hour examination

Prerequisites: All second-year algebra and arithmetic. Students who have not taken Part A Number Theory should read about quadratic residues in, for example, the appendix to Stewart and Tall. This will help with the examples.

Weight: One unit, or Polynomial Rings and Galois Theory can be taken as half-unit but Algebraic Number Theory cannot.

2.11.1 B9a: Polynomial Rings and Galois Theory —Dr Szendroi — 16 MT

[Option **B9a** if taken as a half-unit.]

Aims and Objectives The course starts with a review of second-year ring theory with a particular emphasis on polynomial rings. We also discuss general integral domains and fields of fractions. This is followed by the classical theory of Galois field extensions, culminating in a discussion of some of the classical theorems in the subject: the insolubility of the general quintic and impossibility of certain ruler and compass constructions considered by the Ancient Greeks.

Learning outcomes Understanding of the relation between symmetries of roots of a polynomial and its solubility in terms of simple algebraic formulae; working knowledge of interesting group actions in a nontrivial context; working knowledge, with applications, of a nontrivial notion of finite group theory (soluble groups); understanding of the relation between algebraic properties of field extensions and geometric problems such as doubling the cube and squaring the circle.

Synopsis Review of polynomial rings, factorisation, integral domains. Any nonzero homomorphism of fields is injective. Fields of fractions.

Review of group actions on sets, Gauss' lemma and Eisenstein's criterion for irreducibility of polynomials, field extensions, degrees, the tower law. Symmetric polynomials.

Separable extensions. Splitting fields. The theorem of the primitive element. The existence and uniqueness of algebraic closure.

Groups of automorphisms, fixed fields. The fundamental theorem of Galois theory.

Examples: Kummer extensions, cyclotomic extensions, finite fields and the Frobenius automorphism. Techniques for calculating Galois groups.

Soluble groups. Solubility by radicals, solubility of polynomials of degree at most 4, insolubility of the general quintic, impossibility of some ruler and compass constructions.

Reading

4. Herstein, *Topics in Algebra*, Wiley (1975)

2.11.2 B9b: Algebraic Number Theory — Prof Heath-Brown — 16 HT

Aims and Objectives An introduction to algebraic number theory. The aim is to describe the properties of number fields, but particular emphasis in examples will be placed on quadratic fields, where it is possible to really calculate the properties of some of the objects being considered. In such fields the familiar unique factorisation enjoyed by the integers may fail, and a key objective of the course is to introduce the class group which measures the failure of this property.

Learning outcomes Students will learn about the arithmetic of algebraic number fields. They will find out about integral bases, and unique factorisation into ideals. They will learn to calculate class numbers, and to use the theory to solve simple Diophantine equations.

Synopsis

1. field extensions, minimum polynomial, algebraic numbers, conjugates, -discriminants, Gaussian integers, algebraic integers, integral basis
2. examples: quadratic fields, cyclotomic fields
3. norm of an algebraic number
4. existence of factorisation
5. factorisation in $\mathbb{Q}(\sqrt{d})$
6. ideals, \mathbb{Z} -basis, maximal ideals, prime ideals
7. unique factorisation theorem of ideals
8. relationship between factorisation of number and of ideals
9. norm of an ideal
10. ideal classes
11. statement of Minkowski convex body theorem
12. finiteness of class number
13. computations of class number to go on example sheets

Reading

2.12 B10: Martingales and Financial Mathematics

Level: H-level **Method of Assessment:** 3-hour or $1\frac{3}{4}$ -hour examination

Prerequisites: For Part I, Martingales Through Measure Theory, the Part A courses on Integration and on Topology are helpful but not essential; for Part II, Mathematical Models of Financial Derivatives requires second-year Probability.

Weight: One unit, or can be taken as either a half-unit in Martingales or a half-unit in Mathematical Models of Financial Derivatives.

2.12.1 B10a: Martingales Through Measure Theory — Dr Kristensen — 16 MT

[Option **B10a** if taken as a half-unit.]

Aims & Objectives It was observed by Brown that a pollen particle on the surface of water performs an erratic motion. However, the statistical properties of this motion are predictable and find close parallels in many other settings. The challenge is to create the mathematical framework needed to describe and study such stochastic processes. Certainly it involves probability, but tossing coins and throwing dice only hint at the kind of mathematics required to discuss the situation where the outcome of an experiment is a random path or random sequence. The transition taking probability from heuristic philosophy and into mathematics started with Kolmogorov; the construction of Brown's motion as a mathematical object is due to Wiener. New and basic ideas continued to emerge throughout the 20th century (Itô's paper with his celebrated calculus was published in 1942).

Today, probability theory is a substantial part of mathematics, still under active development, strongly interacting with applications (e.g. Finance) and with other areas of mathematics.

The aim of the course is to explain and develop, in a rigorous way, some of the basic tools: measure theory and (discrete parameter) martingales.

Synopsis σ -algebra, measurable space. σ -algebra generated by a family of sets. The Borel σ -algebra. Measurable functions and their elementary properties, including approximation by simple functions. σ -algebra generated by a family of functions.

Measure, measure space. Uniqueness of extension from a π -system (proof not examinable). [Caratheodory's construction of σ -algebra and measure. Existence and uniqueness of Lebesgue measure].

Events, probability triple, and the first Borel Cantelli lemma with applications. Random variables and their distribution functions. Skorokod representation of random variable with prescribed distribution function. Independence for events, random variables and σ -algebras. π -systems criterion for independence. The tail σ -algebra, Kolomogorov's 0–1 Law. The Second Borel Cantelli lemma.

Integration and expectation. Elementary properties of the integral, including the statements of Monotone Convergence Theorem, Fatou's Lemma and the Dominated Convergence Theorem. [Product of σ -algebras, product measures. Tonelli's Theorem, Fubini's Theorem. The Radon Nikodym Theorem.] Jensen's inequality. [L^p spaces, Hölder's and Minkowski's inequalities.]

The Kolmogorov definition of conditional expectation. Completeness of L^2 , elementary properties of conditional expectation, conditional expectation as best mean-square approximation. Filtrations and martingales. Gambling systems exploded: Stopping times, discrete stochastic integrals, Optional Stopping Theorem. Convergence and upcrossing. A Strong Law of Large Numbers.

[]=covered informally, without proofs.

2.12.2 B10b: Mathematical Models of Financial Derivatives — Dr Hambly — 16 HT

[Option B10b if taken as a half-unit.]

Aims & Objectives The course aims to introduce students to mathematical modelling in financial markets. At the end of the course the student should be able to formulate a model for an asset price and then determine the prices of a range of derivatives based on the underlying asset using arbitrage free pricing ideas.

Synopsis Introduction to markets, assets, interest rates and present value; arbitrage and the law of one price: European call and put options, payoff diagrams. Introduction to Brownian motion, continuous time martingales, informal treatment of Ito's formula and stochastic differential equations. Discussion of the connection with PDEs through the Feynman-Kac formula.

The Black-Scholes analysis via delta hedging and replication, leading to the Black-Scholes partial differential equation for a derivative price. General solution via Feynman-Kac and risk neutral pricing, explicit solution for call and put options.

Extensions to assets paying dividends, time-varying parameters. Forward and future contracts, options on them. American options, formulation as a free-boundary problem and a linear complementarity problem. Simple exotic options. Weakly path-dependent options including barriers, lookbacks and Asians.

2.13 B11: Communication Theory — Dr Stirzaker — 16 MT

NB: OB22: Integer Programming is a very suitable complement to this course.

Level: H-level

Method of Assessment: $1\frac{3}{4}$ -hour examination

Prerequisites: Part A Probability would be helpful, but not essential

Weight: Half-unit

Aims & Objectives The aim of the course is to investigate methods for the communication of information from a sender, along a channel of some kind, to a receiver. If errors are not a concern we are interested in codes that yield fast communication, whilst if the channel is noisy we are interested in achieving both speed and reliability. A key concept is that of information as reduction in uncertainty. The highlight of the course is Shannon's Noisy Coding Theorem.

Synopses Uncertainty (entropy); conditional uncertainty; information. Chain rules; relative entropy; Gibbs' inequality; asymptotic equipartition. Instantaneous and uniquely decipherable codes; the noiseless coding theorem for discrete memoryless sources; constructing compact codes.

The discrete memoryless channel; decoding rules; the capacity of a channel. The noisy coding theorem for discrete memoryless sources and binary symmetric channels.

Extensions to more general sources and channels.

Error-detection and error-correction. Equivalence of codes. Constraints upon the choice of good codes; the Hamming (sphere-packing) and the Gilbert–Varshamov bounds.

2.14 B21 Numerical Solution of Differential Equations

[From Part B2 in the Honour School of Computer Science. Teaching responsibility of the Computing Laboratory.]

2.14.1 B21a Numerical Solution of Differential Equations I — Prof Süli — 16 MT

Overview To introduce and give an understanding of numerical methods for the solution of ordinary and partial differential equations, their derivation, analysis and applicability.

The MT lectures are devoted to numerical methods for initial value problems, while the HT lectures concentrate on the numerical solution of boundary value problems.

Syllabus Initial value problems for ordinary differential equations: Euler, multistep and Runge-Kutta; stiffness; error control and adaptive algorithms.

Initial value problems for partial differential equations: parabolic equations, hyperbolic equations; explicit and implicit methods; accuracy, stability and convergence, Fourier analysis, CFL condition.

Synopsis The MT part of the course is devoted to the development and analysis of numerical methods for initial value problems. We begin by considering classical techniques for the numerical solution of ordinary differential equations. The problem of stiffness is then discussed in tandem with the associated questions of step-size control and adaptivity.

Initial value problems for ordinary differential equations: Euler, multistep and Runge-Kutta; stiffness; error control and adaptive algorithms. [Introduction (1 lecture) + 5 lectures]

The remaining lectures focus on the numerical solution of initial value problems for partial differential equations, including parabolic and hyperbolic problems.

Initial value problems for partial differential equations: parabolic equations, hyperbolic equations; explicit and implicit methods; accuracy, stability and convergence, Fourier analysis, CFL condition. [10 lectures]

Reading List

The course will be based on the following textbooks:

1. K. W. Morton and D. F. Mayers, *Numerical Solution of Partial Differential Equations*, Cambridge University Press, 1994. ISBN 0-521-42922-6 (Paperback edition) [Chapters 2, 3 (Secs. 3.1, 3.2), Chapter 4 (Secs. 4.1-4.6), Chapter 5]
2. E. Süli and D. Mayers, *An Introduction to Numerical Analysis*, Cambridge University Press, 2003. ISBN 0-521-00794-1 (Paperback edition) [Chapter 12] A. Iserles, *A First Course in the Numerical Analysis of Differential Equations*, Cambridge University Press, 1996. ISBN 0-521-55655-4 (Paperback edition) [Chapters 1-5, 13, 14]

2.14.2 B21b Numerical Solution of Differential Equations II — Dr Sobey — 16 HT

Overview To introduce and give an understanding of numerical methods for the solution of ordinary and partial differential equations, their derivation, analysis and applicability.

The MT lectures are devoted to numerical methods for initial value problems, while the HT lectures concentrate on the numerical solution of boundary value problems.

Syllabus Boundary value problems for ordinary differential equations: shooting and finite difference methods.

Boundary value problems for PDEs: finite difference discretisation; Poisson equation. Associated methods of sparse numerical algebra: brief consideration of sparse Gaussian elimination, classical iterations, multigrid iterations.

Synopsis The HT part of the course is concerned with numerical methods for boundary value problems. We begin by developing numerical techniques for the approximation of boundary value problems for second-order ordinary differential equations.

Boundary value problems for ordinary differential equations: shooting and finite difference methods. [Introduction (1 lecture) + 2 lectures]

Then we consider finite difference schemes for elliptic boundary value problems. This is followed by an introduction into the theory of direct and iterative algorithms for the solution of large systems of linear algebraic equations which arise from the discretisation of elliptic boundary value problems.

Boundary value problems for PDEs: finite difference discretisation; Poisson equation. Associated methods of sparse numerical algebra: sparse Gaussian elimination, classical iterations, multigrid iterations. [13 lectures]

Reading List

This course does not follow any particular textbook, but the following essentially cover the material:

1. A. Iserles, *A First Course in the Numerical Analysis of Differential Equations*, Cambridge U. Press, 1996, Chapters 7,10,11.
2. K. W. Morton and D. F. Mayers, *Numerical Solution of Partial Differential Equations*, Cambridge University Press, 1994. Or the more recent 2nd edition (2005), Chapters 6 and 7.

Also

1. G.D. Smith, *Numerical Solution of Partial Differential Equations: Finite Difference Methods*, Clarendon Press, Oxford, 1985 (and any later editions) has some of the material in chapter 5.

2.15 B22 Integer Programming — Dr Hauser — 16 MT

[From Part B2 in the Honour School of Computer Science. Teaching responsibility of the Computing Laboratory.]

Aims In many areas of practical importance linear optimisation problems occur with integrality constraints imposed on some of the variables. In optimal crew scheduling for example, a pilot cannot be fractionally assigned to two different flights at the same time. Likewise, in combinatorial optimisation an element of a given set either belongs to a chosen subset or it does not. Integer programming is the mathematical theory of such problems and of algorithms for their solution. The aim of this course is to provide an introduction to some of the general ideas on which attacks to integer programming problems are based: generating bounds through relaxations by problems that are easier to solve, and branch-and-bound.

Synopsis Lecture 1: Course outline. What is integer programming (IP)? Some classical examples.

Lecture 2: Further examples, hard and easy problems.

Lecture 3: Alternative formulations of IPs, linear programming (LP) and the simplex method.

Lecture 4: LP duality, sensitivity analysis.

Lecture 5: Optimality conditions for IP, relaxation and duality.

Lecture 6: Unimodularity, network.
 Lecture 7: Optimal trees, submodularity, matroids and greedy algorithms.
 Lecture 8: Augmenting paths and bipartite matching.
 Lecture 9: The assignment problem.
 Lecture 10: Dynamic programming.
 Lecture 11: Knapsack problems.
 Lecture 12: Branch-and-bound.
 Lecture 13: More on branch-and-bound.
 Lecture 14: Lagrangian relaxation and the symmetric travelling salesman problem.
 Lecture 15: Solving the Lagrangian dual.
 Lecture 16: Semidefinite programming relaxation and the max-cut problem.

Reading List

Further materials posted on the course web page.

Part C (M-level) courses available in the third year

2.16 C3.1: Geometry: Topology and Groups and Algebraic Topology

Level: M-level **Method of Assessment:** 3 hour examination or $1\frac{3}{4}$ hour examination for half unit

Weight: one unit, or can be taken as either a half-unit in C3.1a or C3.1b.

2.16.1 C3.1a: Topology and Groups – Dr Lackenby – 16 MT — M-Level

Prerequisites second year Groups in action second year Topology

Learning outcomes This course introduces the important link between topology and group theory. On the one hand, associated to each space, there is a group, known as its fundamental group. This can be used to solve topological problems using algebraic methods. On the other hand, many results about groups are best proved and understood using topology. For example, presentations of groups, where the group is defined using generators and relations, have a topological interpretation. The endpoint of the course is the Nielsen-Shreier theorem, an important, purely algebraic result, which is proved using topological techniques.

Synopsis Homotopic mappings, homotopy equivalence. Simplicial complexes. Simplicial approximation theorem.

The fundamental group of a space. The fundamental group of a circle. Application: the fundamental theorem of algebra. The fundamental groups of spheres.

Free groups. Existence and uniqueness of reduced representatives of group elements. The fundamental group of a bouquet of circles.

Groups defined by generators and relations (with examples). Tietze transformations.

The Seifert van Kampen theorem.

Cell complexes. The fundamental group of a cell complex (with examples).

The realization of any finitely presented group as the fundamental group of a finite cell complex. Van Kampen diagrams.

The free product of two groups. Amalgamated free products. HNN extensions.

Covering spaces. Liftings of paths and homotopies. A covering map induces an injection between fundamental groups. The use of covering spaces to determine fundamental groups: the circle again, and real projective n -space. The correspondence between covering spaces and subgroups of the fundamental group. Regular covering spaces and normal subgroups.

Cayley graphs of a group. The relationship between the universal cover of a cell complex, and the Cayley graph of its fundamental group. The Cayley 2-complex of a group.

The Nielsen-Schreier theorem (every subgroup of a free group is free) proved using covering spaces.

2.16.2 C3.1b: Algebraic Topology — Prof Tillmann — 16 HT — M-Level

Prerequisites Ideally students will also take the Topology and Groups course in Michaelmas, though this is not absolutely necessary.

Aims and Objectives Homology theory is a subject that pervades much of modern mathematics. Its basic ideas are used in nearly every branch, pure and applied. In this course, the homology groups of topological spaces are studied. These powerful invariants have many attractive applications. For example we will prove that the dimension of a vector space is a topological invariant and the fact that a ‘hairy ball can not be combed’.

Learning outcomes At the end of the course, students are expected to understand the basic algebraic and geometric ideas that underpin homology and cohomology theory. These include the cup product and Poincaré Duality for manifolds. They should be able to choose between the different homology theories and to use calculational tools such as the Mayer-Vietoris sequence to effectively compute the homology and cohomology of easy examples, including projective spaces, surfaces, certain simplicial spaces and cell complexes. At the end of the course, students should also have developed a sense of how the ideas of homology and cohomology may be applied to problems from other branches of mathematics.

Synopsis Chain complexes of abelian groups and their homology. Short exact sequences. Delta (and simplicial) complexes and their homology. Euler characteristic.

Singular homology of topological spaces. Relation of the first homology group to the fundamental group. Relative homology and the Five Lemma. Homotopy invariance and excision (details of proofs not examinable). Mayer-Vietoris Sequence. Equivalence of simplicial and singular homology. Axioms of homology.

Degree of a self-map of a sphere. Cell complexes and cellular homology. Application: the hairy ball theorem.

Cohomology of spaces and the Universal Coefficient Theorem (proof not examinable). Cup products. Künneth Theorem (without proof). Topological manifolds and orientability. The fundamental class of an orientable, closed manifold and the degree of a map between manifolds of the same dimension. Poincaré Duality (without proof).

2.17 C5.1a: Partial Differential Equations for Pure and Applied Mathematicians (M-level)— Dr Dyson — 16MT

Level: M-level

Weight: Half-unit.

Method of Assessment: $1\frac{3}{4}$ -hour examination

Prerequisites:

Lebesgue integration would be useful but is not essential.

Aims & Objectives The course will introduce some of the modern techniques in partial differential equations that are central to the theoretical and numerical treatments of linear and nonlinear partial differential equations arising in science, geometry and other fields.

It provides valuable background for the Part C courses on Calculus of Variations and Finite Element Methods.

Learning outcomes Students will learn techniques and results, such as Sobolev spaces, weak convergence, weak solutions, the direct method of calculus of variations, embedding theorems, the Lax-Milgram theorem, the Fredholm Alternative and the Hilbert Schmidt theorem and how to apply these to obtain existence and uniqueness results for linear and nonlinear elliptic partial differential equations.

Synopsis

Part I Function Spaces:

Why are function spaces important for partial differential equations?

User's guide to the Lebesgue integral. Definition of Banach spaces, separability and dual spaces. Definition of Hilbert space. The spaces $L^p(\Omega)$, $1 \leq p \leq \infty$, where $\Omega \subset \mathbb{R}^n$ is open. Minkowski and Hölder inequalities. Statement that $L^p(\Omega)$ is a Banach space, and that the dual of L^p is $L^{p'}$, for $1 \leq p < \infty$. Statement that L^2 is a Hilbert space.

Weak and weak* convergence in L^p spaces. Examples. A bounded sequence in a separable Hilbert space has a weakly convergent subsequence.

Mollifiers and the density of smooth functions in L^p for $1 \leq p < \infty$.

Definition of weak derivatives and their uniqueness. Definition of Sobolev space $W^{m,p}(\Omega)$, $1 \leq p \leq \infty$. $H^m(\Omega) = W^{m,2}(\Omega)$. Definition of $W_0^{1,p}(\Omega)$, $1 \leq p < \infty$.

Part II Elliptic Problems:

The direct method of calculus of variations: The Poincaré inequality. Proof of the existence and uniqueness of a weak solution to Poisson's equation $-\Delta u = f$, with zero Dirichlet boundary conditions and $f \in L^2(\Omega)$, with Ω bounded. Discussion of regularity of solutions.

The Lax Milgram lemma and Gårding's inequality. Existence and uniqueness of weak solutions to general linear uniformly elliptic equations.

Embedding theorems (proofs omitted except $W^{1,1}(a,b) \hookrightarrow C[a,b]$).

Compact operators and self adjoint operators. Fredholm Alternative and Hilbert Schmidt Theorem. Examples including $-\Delta$ with zero Dirichlet boundary conditions.

A nonlinear elliptic problem treated by the direct method.

2.18 C9.1a: Analytic Number Theory — Prof Heath-Brown — 16MT — M-Level

Level: M-Level **Weight:** Half-unit

Method of Assessment: $1\frac{3}{4}$ hour examination

Prerequisites

Complex Analysis (Holomorphic and Meromorphic functions, Cauchy's Residue Theorem, Evaluation of integrals by contour integration, Uniformly convergent sums of holomorphic functions). Elementary Number Theory (Unique Factorization Theorem).

Aims and Objectives The course aims to introduce students to the theory of prime numbers, showing how the irregularities in this elusive sequence can be tamed by the power of complex analysis. The course builds up to the Prime Number Theorem which is the corner-stone of prime number theory, and culminates in a description of the Riemann Hypothesis, which is arguably the most important unsolved problem in modern mathematics.

Learning outcomes The course will teach students to handle multiplicative functions, to deal with Dirichlet series as functions of a complex variable, and to prove the Prime Number Theorem and simple variants.

Synopsis Introductory material on primes

Arithmetic functions - Mobius function, Euler function, Divisor function, Sigma function - multiplicativity

Dirichlet series - Euler products - von Mangoldt function

Riemann Zeta-function - analytic continuation to $Re(s) > 0$

Non-vanishing of zeta(s) on $Re(s) = 1$

Proof of the prime number theorem

The Riemann hypothesis and its significance.

The Gamma function, the functional equation for zeta(s), the value of zeta(s) at negative integers.

2.19 BE “Mathematical” Extended Essay

Level H-level

Method of Assessment: written extended essay

Weight: One unit

See the “Projects Guidance Notes” on the website at <http://www.maths.ox.ac.uk/current-students/undergraduates/projects/> for more information on this option and an application form.

3 Other Mathematical units and half-units

3.1 O1: History of Mathematics — Dr Flood, Dr Neumann, Dr Stedall and Dr Wilson — 16 MT and 8 HT

Level: H-level

Method of Assessment: 2 hour written examination paper for the MT lectures and 3000 word mini project for the reading course.

Prerequisites: None.

Weight: One unit.

Quota: The maximum number of students that can be accepted for 2006-7 will be 30.

Learning outcomes

This course is designed to provide the historical background to some of the mathematics familiar to students from A-level and four terms of undergraduate study, and looks at a period from approximately the mid sixteenth century to the end of the nineteenth century. The course will be delivered through 16 lectures in Michaelmas Term, and a Reading Course consisting of 8 seminars (equivalent to a further 16 lectures) in Hilary Term. Guidance will be given throughout on reading, note-taking and essay-writing skills. Students will gain:

- an understanding of university mathematics in its historical context
- an enriched understanding of mathematical content in the topics covered by the course together with skills in:
 - historical analysis of primary source material
 - selective reading from a variety of secondary sources
 - efficient note-taking
 - writing well-argued essays (ranging in length from 800 to 3000 words)
 - accurate referencing and construction of bibliographies
 - verbal presentation and discussion

Lectures

1. Week 1
Introduction
2. Week 2
 - (a) The development of the calculus
 - (b) Mathematics and the physical world
3. Week 3
 - (a) Calculus in the eighteenth century
 - (b) Probability
4. Week 4
 - (a) Problems of rigour
 - (b) Functions, limits, continuity
5. Week 5
 - (a) Polynomial equations and solvability
 - (b) Groups and fields
6. Week 6
 - (a) Integrations
 - (b) Complex analysis
7. Week 7
 - (a) Sequences and series
 - (b) Foundations
8. Week 8
 - (a) Linear algebra
 - (b) Geometry

The lecturers will set six exercise sheets (including suggested reading, extracts from primary sources on which the student will be expected to comment, and short essay titles). Written work will be discussed in six weekly intercollegiate classes in the usual way.

Reading Courses In Hilary Term each student will select a Reading Course from a choice of options. Courses will be run according to demand, requiring ideally a minimum of five and a maximum of eight students on each. Students will be expected to write three essays during the first six weeks of term. The course will be examined by a miniproject of 3000 words to be completed during Weeks 7 to 9. Topics offered for 2006-2007 will be: 1. Mathematics and institutions 2. Origins of group theory

Reading

1. Victor Katz, *A history of mathematics: an introduction (2nd edition)*, Addison Wesley Longman 1998.

2. John Fauvel and Jeremy Gray (eds), *The history of mathematics: a reader*, Macmillan 1987.
3. We also expect that additional material relating to the course, including primary source material, will be available on CD.

Introductory and background reading:

1. Dirk Struik, *A concise history of mathematics (4th revised edition)*, Dover 1987.
2. Hodgkin, Luke, *A history of mathematics: from Mesopotamia to modernity*, OUP 2005.

Assessment The Michaelmas Term lectures will be examined in a two-hour written paper at the end of Trinity Term. Candidates will be expected to answer two half-hour questions (commenting on extracts) and one one-hour question (essay). The paper will account for 50% of the marks for the course. The Reading Course will be examined by a 3000 word miniproject at the end of Hilary Term. The title will be set at the beginning of Week 7 and two copies of the project must be submitted to the Examination Schools by midday on Friday of Week 9. The miniproject will account for 50% of the marks for the course.

3.2 OBS1: Applied Statistics

[Paper BS1 in the Honour School of Mathematics & Statistics. Teaching responsibility of the Department of Statistics.]

Level: H-level

Method of Assessment: 2-hour examination plus assessed practical assignments

Prerequisites: Part A Probability and Statistics.

Weight: One unit.

Applied Statistics I – Lecturer TBC – 16 MT

Applied Statistics II – Lecturer TBC – 10 HT

Aims The course aims to develop the theory of statistical methods, and also to introduce students to the analysis of data using a statistical package. The main topics are: Simulation, Practical aspects of linear models, Logistic regression and generalized linear models, and Robust and computer-intensive methods.

Synopsis *Michaelmas Term (16 lectures)*

Simulation: pseudo-random numbers, inversion, rejection, composition, ratio-of-uniforms and alias methods, computational efficiency.

Practical aspects of linear models: review of multiple regression, analysis of variance, model selection, fit criteria, use of residuals, outliers, leverage, Box-Cox transformation, added-variable plots, model interpretation.

Logistic regression. Linear exponential families and generalized linear models, scale parameter, link functions, canonical link. Maximum likelihood fitting and iterated weighted least squares. Asymptotic theory: statement and applications to inference, analysis of deviance, model checking, residuals. Examples: binomial, Poisson and gamma models.

Hilary Term (10 lectures)

Robust statistics. Univariate methods, robust regression (M-estimation), resistant regression.

Computer-intensive statistics. Smoothing methods (kernels, splines, local polynomials). Bootstrapping. Monte Carlo tests.

Reading (Michaelmas Term) S. M. Ross, *Simulation*, 2nd edition, Academic Press (1996)

A. J. Dobson, *An Introduction to Generalized Linear Models*, Chapman and Hall (1990)

D. Lunn, *Notes* (2003)

Reading (Hilary Term) P. J. Rousseeuw and A. M. Leroy, *Robust Regression and Outlier Detection*, Wiley (1987), pp 1-194.

Further Reading F. L. Ramsey and D. W. Schafer, *The Statistical Sleuth: A Course in Methods of Data Analysis*, 2nd edition, Duxbury (2002)

W. N. Venables and B. D. Ripley, *Modern Applied Statistics with S*, Springer (2002)

Practicals In addition to the lectures there will be four supervised practicals, each containing one or more problems whose written solutions will be assessed as part of the unit examination. Similar practical applications will be used as illustrations in lectures.

3.3 OBS2a: Statistical Inference – Lecturer TBC — 16MT

Aims

This course presents concepts and results underlying the Bayesian, frequentist and decision-theoretic approaches to statistical inference, with emphasis on the contrasts between them.

Synopsis Exponential families: maximum likelihood estimation; sufficiency; conditional inference.

Decision theory: risk function; randomized decision rules; admissibility; Rao-Blackwell theorem; minimax and Bayes rules; James-Stein estimator.

Bayesian methods: conjugate prior families; subjective probability; predictive distributions; hierarchical models; computational techniques; data examples; asymptotics; Laplace approximation; empirical Bayes; shrinkage.

Comparing hypotheses: frequentist and decision-theoretic approach; Bayes factors; BIC.

Recommended textbooks:

1. G.A. Young and R.L. Smith, *Essentials of Statistical Inference*, Cambridge University Press, 2005.
2. T. Leonard and J.S.J. Hsu, *Bayesian Methods*, Cambridge University Press, 1999.

3.4 OBS3: Stochastic Modelling

[Paper BS3 in the Honour School of Mathematics & Statistics. Teaching responsibility of the Department of Statistics.]

Level: H-level

Method of Assessment: 3-hour or $1\frac{3}{4}$ -hour examination

Prerequisites: For the first 16 lectures, Part A Probability. For the second 16 lectures, Part A Statistics also.

Weight: One unit, or the first 16 lectures can be taken as a half-unit in Applied Probability. (The second 16 lectures cannot be taken as a half-unit.)

Aims: This unit has been designed so that a student obtaining at least an upper second class mark on the whole unit can expect to gain exemption from the Institute of Actuaries' paper CT4, which is a compulsory paper in their cycle of professional actuarial examinations. The first half of the unit, clearly, and also the second half of the unit, apply much more widely than just to insurance models.

3.4.1 OBS3a: Applied Probability – Dr Winkel – 16 MT

Aims This course is intended to show the power and range of probability by considering real examples in which probabilistic modelling is inescapable and useful. Theory will be developed as required to deal with the examples.

Synopsis Poisson processes and birth processes. Continuous-time Markov chains. Transition rates, jump chains and holding times. Forward and backward equations. Class structure, hitting times and absorption probabilities. Recurrence and transience. Invariant distributions and limiting behaviour. Time reversal.

Applications of Markov chains in areas such as queues and queueing networks - M/M/s queue, Erlang's formula, queues in tandem and networks of queues, M/G/1 and G/M/1 queues; insurance ruin models; epidemic models; applications in applied sciences.

Renewal theory. Limit theorems: strong law of large numbers, strong law and central limit theorem of renewal theory, elementary renewal theorem, renewal theorem, key renewal theorem. Excess life, inspection paradox. Applications.

Reading

3. G.R. Grimmett and D.R. Stirzaker: *One Thousand Exercises in Probability*. Oxford University Press (2001)
4. S.M. Ross: *Introduction to Probability Models*. 4th edition, Academic Press (1989)
5. D.R. Stirzaker: *Elementary Probability*. 2nd edition, Cambridge University Press (2003)

3.4.2 OBS3b: Statistical Lifetime-Models – lecturer TBC – 16 HT

Aims The second half of the unit follows on from the first half on Applied Probability. Models introduced there are examined more specifically in a life insurance context where transitions typically model the passage from 'alive' to 'dead', possibly with intermediate stages like 'loss of a limb' or 'critically ill'. The aim is to develop statistical methods to estimate transition rates and more specifically to construct life tables that form the basis in the calculation of life insurance premiums. Survival analysis will allow consideration of the effect of covariates.

Synopsis Survival models: general lifetime distributions, force of mortality (hazard rate), survival function, specific mortality laws, the single decrement model, curtate lifetimes, life tables.

Estimation procedures for lifetime distributions: empirical lifetime distributions, censoring, Kaplan-Meier estimate, Nelson-Aalen estimate. Parametric models, accelerated life models including Weibull, log-normal, log-logistic. Plot-based methods for model selection. Proportional hazards, partial likelihood.

Two-state and multiple-state Markov models, with simplifying assumptions. Estimation of Markovian transition rates: Maximum likelihood estimators, time-varying transition rates, census approximation.

Graduation, including fitting Gompertz-Makeham model, comparison with standard life table: tests including chi-square test and grouping of signs test, serial correlations test; smoothness.

3.5 OBS4: Actuarial Science

[Paper BS4 in the Honour School of Mathematics & Statistics. Teaching responsibility of the Department of Statistics.]

Level: H-level

Method of Assessment: 3-hour examination

Prerequisites: Part A Probability is useful, but not essential. If you have not done Part A Probability, make sure that you are familiar with Mods work on Probability.

Weight: One unit.

3.5.1 OBS4a: Actuarial Science I – Dr Martin – 16 MT

Aims This unit is supported by the Institute of Actuaries. It has been designed to give the undergraduate mathematician an introduction to the financial and insurance worlds in which the practising actuary works. Students will cover the basic concepts of risk management models for investment and mortality, and for discounted cash flows. In the examination, a student obtaining at least an upper second class mark on this unit can expect to gain exemption from the Institute of Actuaries' paper CT1, which is a compulsory paper in their cycle of professional actuarial examinations.

Synopsis Fundamental nature of actuarial work. Use of generalised cash flow model to describe financial transactions. Time value of money using the concepts of compound interest and discounting. Interest rate models. Present values and accumulated values of a stream of equal or unequal payments using specified rates of interest. Interest rates in terms of different time periods. Equation of value, rate of return of a cash flow, existence criteria.

Loan repayment schemes. Investment project appraisal, funds and weighted rates of return. Inflation modelling, inflation indices, real rates of return, inflation-adjustments. Valuation of fixed-interest securities, taxation and index-linked bonds.

Uncertain payments, corporate bonds, fair prices and risk. Single decrement model, present values and accumulated values of a stream of payments taking into account the probability of the payments being made according to a single decrement model. Annuity functions and assurance functions for a single decrement model. Risk and premium calculation.

3.5.2 OBS4b: Actuarial Science II – Mr Daniel Clarke – 16 HT

Synopsis Liabilities under a simple assurance contract or annuity contract. Premium reserves, Thiele’s differential equation. Expenses and office premiums.

The no-arbitrage assumption, arbitrage-free pricing. Price and value of forward contracts, effect of fixed income or fixed dividend yield from the asset. Futures, options and other financial products.

Investment and risk characteristics of investments. Term structure of interest rates, spot rates and forward rates, yield curves. Stability of investment portfolios, analysis of small changes in interest rates, Redington immunisation.

Simple stochastic interest rate models, mean-variance models, log-normal models. Mean, variance and distribution of accumulated values of simple sequences of payments.

3.6 OCS1: Functional Programming and Data Structures and Algorithms

3.6.1 OCS1a: Functional Programming — Prof Bird — 16 MT

Overview This is a first course in programming. It makes use of a programming language called Haskell, in which programs can be viewed as mathematical functions. This makes the language very powerful, so that we can easily construct programs that would be difficult or very large in other languages.

An important theme of the course is how to apply mathematical reasoning to programs, so as to prove that a program performs its task correctly, or to derive it by algebraic manipulation from a simpler but less efficient program for the same problem.

The course provides hands-on experience of programming through two lab exercises: the first one aims to make you acquainted with the mechanics of writing Haskell programs, and the second one tackles a more challenging programming task.

Learning Outcomes At the end of the course the student will be able to:

1. Write programs in a functional style;
2. Reason formally about functional programs;
3. Use polymorphism and higher-order functions;
4. Reason about the time and space complexity of programs.

Syllabus Principles of functional programming: expressions, evaluations, functions, and types. Type definitions and built-in types: numbers, characters, strings and lists. Basic operations on lists, including map, fold and filter, together with their algebraic properties. Recursive definitions and structural induction. Simple program calculation. Infinite lists and their uses. Further data structures: binary trees, general trees. Use of trees for representing sets and symbolic data. Normal order reduction and lazy evaluation. Simple cost models for functional programs; time and space complexity.

Synopsis Programming with a functional notation: sessions and scripts, expressions and values. Evaluation of expressions. Case study: Approximating square roots. Reduction strategies: innermost vs outermost. [1]

Types and strong-typing. Basic types: Booleans and truth values. Simple programs involving pattern matching. Polymorphism and type classes. Functional application and currying. Functional composition. More types: characters, strings, tuples. Type synonyms. [2]

Lists and their operations; list comprehensions. The functions map, foldl, foldr, concat and filter. Many small examples illustrating the use of these functions in a compositional style of programming. [3]

Time complexity. Asymptotic notation. Advice on writing efficient programs; use of accumulating parameters. [2]

Recursion and induction. The algebraic properties of list functions and their proof by equational reasoning. Simple manipulation of programs to achieve efficiency. [2] Infinite lists and their applications: Pascal's triangle, digits of a number, sieve of Eratosthenes. Infinite lists as limits. Proving properties of infinite lists: induction, take lemma. Cyclic structures. [2]

Non-linear data structures. Binary trees and the relationship between size and depth. Binary search trees for representing sets. Insertion and searching in a binary search tree. Representing and evaluating arithmetic expressions. [3]

More advice on writing efficient programs: halve instead of decrease; tupling and accumulation. Space complexity and the use of strict. [1]

More substantial examples if time allows.

3.6.2 OCS1b: Data Structures and Algorithms — Prof Ong — 16 HT

Overview This core course covers good principles of algorithm design, elementary analysis of algorithms, and fundamental data structures. The emphasis is on choosing appropriate data structures and designing correct and efficient algorithms to operate on these data structures.

Learning Outcomes This is a first course in data structures and algorithm design. Students will:

1. learn good principles of algorithm design;
2. learn how to analyse algorithms and estimate their worst-case and average-case behaviour (in easy cases);
3. become familiar with fundamental data structures and with the manner in which these data structures can best be implemented;
4. become accustomed to the description of algorithms in both functional and procedural styles;
5. learn how to apply their theoretical knowledge in practice (via the practical component of the course).

Syllabus Basic strategies of algorithm design: top-down design, divide and conquer, average and worst-case criteria, asymptotic costs. Simple recurrence relations for asymptotic costs. Choice of appropriate data structures: arrays, lists, stacks, queues, trees, heaps, priority queues, graphs, hash tables. Applications to sorting and searching, matrix algorithms, shortest-path and spanning tree problems. Introduction to discrete optimisation algorithms: dynamic programming, greedy algorithms. Graph algorithms: depth first and breadth first search.

Synopsis Program costs: time and space. Worst case and average case analysis. Asymptotics and "big O" notation. Polynomial and exponential growth. Asymptotic estimates of costs for simple algorithms. Use of induction and generating functions. [2]

Data structures and their representations: arrays, lists, stacks, queues, trees, heaps, priority queues, graphs. [3]

Algorithm design strategies: top down design, divide and conquer. Application to sorting and searching and to matrix algorithms. Solution of relevant recurrence relations. [4]

Graph algorithms: examples of depth-first and breadth-first search algorithms. Topological sorting, connected components. [3]

Introduction to discrete optimisation algorithms: dynamic programming, greedy algorithms, shortest path problems. [2]

Linear sorting and comparator networks (if time).

3.7 OCS2a: Logic of Multi Agent Information Flow — Dr Baltag — 16 MT

Overview

The course is addressed to both MSc students (in Mathematics, CS and MFoCS) and final year BA students (in any of the following fields: Maths, CS, Maths and Comp, MMath, and Math and Philosophy), with an interest in Logic, AI and the dynamics of information in multi-agent systems. It explores and compares various logical approaches to information flows based on the use of modal logics, on formal languages for the specification of knowledge-related features of a system, and on the use of Kripke models (or transition systems), as abstract models for information systems. A range of important mathematical techniques (such as completeness and decidability proofs, denability and expressivity results etc.) and concepts (bisimulation, canonical models, filtration etc.) are introduced

and explained. The course presents applications of these notions to the analysis of information update and communication, and of the role of beliefs and belief-changing actions, in the overall dynamics of any "society" of intelligent agents (e.g. the Internet, the market, communicating networks of robots, cryptographic communication between unreliable or adversary agents over un-secure channels etc.). Finally, a comparison is made with other standard approaches to communication and information e.g. equational logics (calculi) based on process algebras.

Prerequisites The course assumes some familiarity with the basic notions of classical Propositional Calculus, as well as with very basic mathematical notions: sets (and operations with sets: union, intersection, Cartesian product et.) and binary relations (e.g. transitivity, reflexivity, equivalence relations etc.). Apart from this, the course is essentially self-contained. But some ability to quickly learn and understand new mathematical notions, and to apply them to simple examples, would be most welcome.

Course Outline There are three main parts to the course:

Introduction to knowledge and information in multi-agent systems. Agents, systems, knowledge, belief, common knowledge, distributed knowledge. Evolving knowledge. Belief-changing actions. Examples. Kripke models (processes, transition systems), interpreted systems. Modal logic (epistemic and doxastic logic, temporal logic, PDL, Hoare logic). Bisimulation.

Logical approaches to knowledge and information Interpreted systems: runs and protocols. Temporal epistemic logic. Dynamic epistemic logic. The logics of public and fully private announcements. The logic of epistemic programs. The calculus of epistemic actions. Proof systems. Applications.

Proof theory and meta-theory Invariance results. Finite models. Characterization and definability. Expressivity. Completeness and decidability proofs. Comparison with other approaches.

Learning Outcomes At the end of the course students are expected to:

1. Be able to model and analyze given examples of knowledge and information and to reason about them using one of the formal logics presented in the course.
2. Perform model checking for given modal (dynamic, temporal, epistemic) formulas over given information models.
3. Understand and be able to explain and illustrate the main techniques and concepts (filtration, canonical models, finite model property) involved in the completeness and decidability proofs, and to sketch the main steps of these proofs for a given logic.
4. Compare the expressivity of two given logics over a class of information models.

Syllabus Examples of multi-agent information systems and their models: Kripke models, transition systems, interpreted systems, dynamic-epistemic models. Syntax and Semantics

of Modal Logics: epistemic logic, temporal logic, PDL, dynamic-epistemic logics, the logic of epistemic programs. Bisimulation, characterization, definability, expressivity. Completeness: canonical models and filtration. Decidability: finite model property, normal form.

Synopsis Part 1: Introduction to knowledge and information in multi-agent systems.

(3-4 lectures in total)

1. (1-2 lectures) Examples of multi-agent information systems. The Muddy Children Puzzle. The Coordinated Attack. The Simultaneous Byzantine Agreement. The Surprise Examination Paradox. Games of imperfect information. Cryptographic protocols. Knowledge, belief, common knowledge, distributed knowledge. Evolving knowledge. Belief-changing actions.
2. (1-2 lectures) Models and logics of knowledge, belief, time and change: Kripke models (processes, transition systems, epistemic models, temporal models, dynamic models, interpreted systems); modal logics (epistemic and doxastic logic, temporal logic, PDL, Hoare logic). Notions of bisimulation.

Part 2: Logical approaches to knowledge and information (6 lectures in total)

1. (1 lecture) Interpreted systems: runs, systems, programs, protocols.
2. (1 lecture) Temporal-epistemic logics. BAN logic.
3. (2 lectures) Dynamic-epistemic logics: the logic of public announcements, the logic of fully private announcements, the logic of "game" announcements; the logic of epistemic programs. Epistemic updates. The product update.
4. (1 lecture) Operations with epistemic programs. Learning a program. The calculus of epistemic actions. Axioms for dynamic epistemic logics. The Knowledge-Action Axiom and the Action Rule.
5. (1 lecture) Applications to the analysis of information solutions to the Muddy Children Puzzle and other paradoxes; dialogue games, communication strategies; cryptographic attacks.

Part 3: Proof theory and meta-theory

(6-7 lectures in total)

1. (1 lecture) Invariance results. Finite models. Characterization and definability. Expressivity.
2. (3-4 lectures) Completeness and decidability proofs: canonical models, filtration, the truth lemma, finite model property, normal forms, rewriting systems.
3. (1 lecture) Comparison with other approaches: process algebras and equational calculi.
4. (1 lecture) Comparison with other approaches: systems for belief revision; game theory.

3.8 OCS3a Lambda Calculus & Types — Dr Ker — 16 MT

Overview

As a language for describing functions, any literate computer scientist would expect to understand the vocabulary of the lambda calculus. It is folklore that various forms of the lambda calculus are the prototypical functional programming languages, but the pure theory of the lambda calculus is also extremely attractive in its own right. This course introduces the terminology and philosophy of the lambda calculus, and then covers a range of self-contained topics studying the language and some related structures. Topics covered include the equational theory, term rewriting and reduction strategies, combinatory logic, Turing completeness and type systems. As such, the course will also function as a brief introduction to many facets of theoretical computer science, illustrating each (and showing the connections with practical computer science) by its relation to the lambda calculus. Although some previous knowledge of computability (such as provided by Computer Science Moderations course in Models of Computation) would be a slight advantage, it is certainly not necessary.

Syllabus Terms, formal theories lambda beta and lambda beta n, fixed point combinators; reduction, Church-Rosser property of beta-reduction and consistency of lambda beta; reduction strategies, proof that leftmost reduction is normalising; Church numerals, definability of total recursive functions in the lambda-calculus, Second Recursion Theorem and undecidability results; combinatory algebras, combinatory completeness, basis; simple types a la Curry, type deductions, Subject Reduction Theorem, strong normalisation and consequences; type substitutions, unification, correctness of Principal Type Algorithm.

Synopsis Chapter 0 (1 lecture)

Introductory lecture. Preparation for use of inductive definitions and proofs.

Chapters 1-3 (5.5 lectures)

Terms, free and bound variables, alpha-conversion, substitution, variable convention, contexts, the formal theory lambda beta, the n rule, fixed point combinators, brief mention of other lambda-theories.

Reduction. The general idea of compatible closure, reflexive transitive closure, diamond and Church-Rosser properties for general notions of reduction. beta-reduction, proof of the Church-Rosser property (via parallel reduction), connection between beta-reduction and lambda beta, consistency of lambda beta. Inconsistency of equating all terms without beta-normal form.

Reduction strategies, head and leftmost reduction. Some analysis of how redexes are created and destroyed (including results used later for typed terms). Proof that leftmost reduction is normalising. Connection with call-by-name and call-by-value functional languages. (Possibly: statement, without proof, of Genericity Lemma in terms of normal forms for head reduction.)

Chapter 4 (2 lectures)

Church numerals, definability of total recursive functions (with extension to partial functions). Second Recursion Theorem, Scott-Curry Theorem, undecidability of equality in lambda beta.

Chapter 5 (2 lectures)

Untyped combinatory algebras. Abstraction algorithm, combinatory completeness, translations to and from untyped lambda-calculus, limits on the correspondence, basis for closed terms. Presentation of a simple combinatory algebra.

Chapters 6-8 (5.5 lectures)

Simple type assignment a la Curry. Contexts and deductions. Construction lemmas (may need to avoid proving everything here). Subject Reduction Theorem.

Some tricky examples about typability, including lack of type invariance under expansion and equality.

Brief look at a system with type invariance under equality. Informal and cursory treatment of Curry-Howard isomorphism.

Cheap proof of strong normalisation for this type system. Consequences: no fixed point combinators, poor definability power. Pointer to literature on PCF as the obvious extension of simple types to cover all computable functions.

Type substitutions and unification. Principal Type algorithm and correctness.

3.9 OE “Other Mathematical” Extended Essay

Level H-level **Method of Assessment:** written essay

Weight: One unit

See the “Projects Guidance Notes” on the website at <http://www.maths.ox.ac.uk/current-students/undergraduates/projects/> for more information on this option and an application form.

4 Non-Mathematical units and half-units

4.1 N1 Undergraduate Ambassadors’ Scheme — mainly HT

Level: H-level **Method of Assessment:** Journal of activities, Oral presentation, Course report and project, Teacher report

Prerequisites: None

Weight: Half-unit

Quota: There will be a quota of approximately 16 students for this course.

Co-ordinator: Dr Earl

Learning outcomes

The Undergraduate Ambassadors' Scheme (UAS) was begun by Simon Singh in 2002 to give university undergraduates a chance to experience assisting and, to some extent, teaching in schools and to be credited for this. The option focuses on improving students' communication, presentation, cooperation and organizational skills and sensitivity to others' learning difficulties.

Course Description and Timing:

The Oxford UAS option, N1, is a half-unit, mainly run in Hilary Term and will be available to BA and MMath Mathematics students in their third year. A quota will be in place, of approximately 16 students, and so applicants for the UAS option will be asked to name a second alternative half-unit. The course is appropriate for all students, whether or not they are interested in teaching subsequently.

A student on the course will be assigned to a mathematics teacher in a local secondary school (in the Oxford, Kidlington, Wheatley area) for half a day per week during Hilary Term. Students will be expected to keep a journal of their activities, which will begin by assisting in the class, but may widen to include teaching the whole class for a part of a period, or working separately with a smaller group of the class. Students will be required at one point to give a presentation to one of their school classes relating to a topic from university mathematics, and will also run a project for a class or group with advice from the teacher. This project might include demonstrations relating to a certain topic, production of website material, arranging an academic-oriented visit to the university etc. Final credit will be based on the journal (20%), the presentation (30%), an end of course report (2000-3000 words) including details of the project (35%), together with a report from the teacher (15%).

Interviews will take place on Thursday or Friday of 0th week in Michaelmas term to select students for this course. The interview (of roughly 15 minutes) will include a presentation by the student on an aspect of mathematics of their choosing. Students will be chosen on the basis of their ability to communicate mathematics, and two references will be sought from college tutors on these qualities. Applicants will be quickly notified of the decision.

During Michaelmas term there will be a Training Day, in conjunction with the Department of Educational Studies, as preparation for working with pupils and teachers, and to provide more detail on the organisation of teaching in schools. Those on the course will also need to fill in a CRB form, or to have done so already. By the end of term students will have been assigned to a teacher and have made a first, introductory, visit to their school. The course will begin properly in Hilary term with students helping in schools for half a day each week. Funds are available to cover travel expenses. Support classes will be provided throughout Hilary for feedback and to discuss issues such as the planning of the project. The deadline for the journal and report will be Friday of 0th week of Trinity term.

Any further questions on the UAS option should be passed on to the option's co-ordinator, Richard Earl (earl@maths.ox.ac.uk).

4.2 N101 History of Philosophy from Descartes to Kant — Varios lecturers — 24MT, 16HT and 8TT

[Paper 101 in all Honour Schools including Philosophy. Teaching responsibility of the Philosophy Faculty.]

Level H-level

Method of Assessment: 3-hour examination

Weight: One unit

For those taking Finals in 2007 and thereafter, paper 101 will have a new format: see below.

Candidates will be expected to show critical appreciation of the main philosophical ideas of the period. The subject will be studied in connection with the following texts: Descartes, Meditations, Objections and Replies; Spinoza, Ethics; Leibniz, Monadology, Discourse on Metaphysics; Locke, Essay Concerning Human Understanding; Berkeley, Principles of Human Knowledge, Three Dialogues Between Hylas and Philonous; Hume, Treatise of Human Nature; Kant, Critique of Pure Reason. The paper will consist of three sections; Section A will include questions about Descartes, Spinoza, and Leibniz; Section B will include questions about Locke, Berkeley and Hume; Section C will include questions about Kant. Candidates will be required to answer three questions, with at least one question from Section A and at least one question from Section B. [Examination Regulations 2005, p. 479.]

4.3 N102 Knowledge and Reality — Prof J. Hawthorne and Dr G. Uzquiano Cruz — 8MT and 8HT

[Paper 102 in all Honour Schools including Philosophy. Teaching responsibility of the Philosophy Faculty.]

Level H-level

Method of Assessment: 3-hour examination

Weight: One unit

Candidates will be expected to show knowledge in some of the following areas: knowledge and justification; perception; memory; induction; other minds; *a priori* knowledge; necessity and possibility; reference; truth; facts and propositions; definition; existence; identity, including personal identity; substances, change, events; properties; causation; space; time; essence; natural kinds; realism and idealism; primary and secondary qualities. There will also be a section on Philosophy of Science. Candidates' answers must not be confined to questions from the section on Philosophy of Science. [Examination Regulations 2005, p. 479.]

4.4 N122 Philosophy of Mathematics — Dr A. Paseau — 16MT

[Paper 122 in all Honour Schools including Philosophy. Teaching responsibility of the Philosophy Faculty.]

Level H-level

Method of Assessment: 3-hour examination

Weight: One unit

Prerequisites No candidate will be permitted this option who is not offering Paper B1

Questions may be set which relate to the following issues: Incommensurables in the development of Greek geometry. Comparisons between geometry and other branches of mathematics. The significance of non-Euclidean geometry. The problem of mathematical rigour in the development of the calculus. The place of intuition in mathematics (Kant, Poincaré). The idea that mathematics needs foundations. The role of logic and set theory (Dedekind, Cantor, Frege, Russell). The claim that mathematics must be constructive (Brouwer). The finitary study of formal systems as a means of justifying infinitary mathematics (Hilbert). Limits to the formalization of mathematics (Gödel). Anti-foundational views of mathematics. Mathematical objects and structures. The nature of infinity. The applicability of mathematics. [Examination Regulations 2005, p. 483.]

5 Language Classes

Mathematics and Mathematics & Statistics students may apply to take language classes. In 2006-7 French Language classes will be run in MT and HT. The courses are run by the University Language Centre.

Students wishing to take language classes should attend the presentation given in Trinity Term at 3.00pm, Friday 12th May (Week 3), at the Language Centre, 12 Woodstock Road. Preliminary registration forms will be available at this presentations but the meeting is a briefing at which students may ask questions. Inability to attend will not affect students' later registration.

If there is sufficient demand, two class will be offered, one for students with good GCSE-level (or equivalent) French and an additional class for those with AS-level/A-level (or equivalent) French. Allocation of a place in a class will depend on performance in the preliminary test which will be held in Week 1 of MT.

Successful completion of the French for Maths course will not contribute to the class of degree awarded in Mathematics. However, upon successful completion of the course, students will be issued with a certificate of achievement which will be sent to their college, and the details may appear on their transcript.

Places at these classes are limited, so students are advised that they should indicate their interest at this stage. If you are interested but were unable to attend this presentation for some reason please contact the Academic Administrator in the Mathematical Institute (academic.administrator@maths.ox.ac.uk; (2)73530) as soon as possible. **Aims and rationale**

The general aim of the language courses is to develop the student's ability to communicate (in both speech and writing) in French to the point where he or she can function in an academic or working environment in a French-speaking country.

The courses have been designed with general linguistic competence in the four skills of reading, writing, speaking and listening in mind. There will be opportunities for participants to develop their own particular interests through presentations and assignments.

Form and Content

Each course will consist of a thirty-two contact hour course, together with associated work. Classes will be held in the Language Centre at two hours per week in Michaelmas and Hilary Terms.

The content of the courses is based on course books together with a substantial amount of supplementary material prepared by the language tutors. Participants should expect to spend an additional two hours per week on preparation and follow-up work.

Each course aims to cover similar ground in terms of grammar, spoken and written language and topics. Areas covered will include:

Grammar:

1. all major tenses will be presented and/or revised, including the subjunctive
2. passive voice
3. pronouns
4. formation of adjectives, adverbs, comparatives
5. use of prepositions
6. time expressions

Speaking

1. guided spoken expression for academic, work and leisure contact (e.g. giving presentations, informal interviews, applying for jobs)
2. expressing opinions, tastes and preferences
3. expressing cause, consequence and purpose

Writing

1. guided letter writing for academic and work contact
2. summaries and short essays

Listening

1. listening practice of recorded materials (e.g. news broadcasts, telephone messages, interviews)
2. developing listening comprehension strategies

Topics (with related readings and vocabulary, from among the following)

1. life, work and culture
2. the media in each country

3. social and political systems
4. film, theatre and music
5. research and innovation
6. sports and related topics
7. student-selected topics

Teaching staff

The courses are taught by Language Centre tutors or Modern Languages Faculty instructors.

Teaching and learning approaches

Each course uses a communicative methodology which demands active participation from students. In addition, there will be some formal grammar instruction. Students will be expected to prepare work for classes and homework will be set. Students will also be given training in strategies for independent language study, including computer-based language learning, which will enable them to maintain and develop their language skills after the course.

Entry

Two classes will be formed according to level of French at entry (in 2004-2005 these were at about post-GCSE and post-A level standard). The minimum entry standard is a good GCSE Grade or equivalent. Registration for each option will take place at the start of Michaelmas Term. A preliminary qualifying test is then taken which candidates must pass in order to be allowed to join the course.

Learning outcomes

The learning outcomes will be based on internationally agreed criteria for specific levels (known as the ALTE levels), which are as follows:

Basic Level (corresponds to ALTE Level 2 “Can-do” statements)

1. Can express opinions on professional, cultural or abstract matters in a limited way, offer advice and understand instructions.
2. Can give a short presentation on a limited range of topics.
3. Can understand routine information and articles, including factual articles in newspapers, routine letters from hotels and letters expressing personal opinions.
4. Can write letters or make notes on familiar or predictable matters.

Threshold Level (corresponds to ALTE Level 3 “Can-do” statements)

1. Can follow or give a talk on a familiar topic or keep up a conversation on a fairly wide range of topics, such as personal and professional experiences, events currently in the news.
2. Can give a clear presentation on a familiar topic, and answer predictable or factual questions.
3. Can read texts for relevant information, and understand detailed instructions or advice.
4. Can make notes that will be of reasonable use for essay or revision purposes.
5. Can make notes while someone is talking or write a letter including non-standard requests.

Higher Level (corresponds to ALTE Level 4 ”Can-do” statements)

1. Can contribute effectively to meetings and seminars within own area of work or keep up a casual conversation with a good degree of fluency, coping with abstract expressions.
2. Can follow abstract argumentation, for example, balancing alternatives and drawing a conclusion.
3. Can read quickly enough to cope with an academic course, to read the media for information or to understand non-standard correspondence.
4. Can prepare/draft professional correspondence, take reasonably accurate notes in meetings or write an essay which shows an ability to communicate, giving few difficulties for the reader.

Assessment

There will be a preliminary qualifying test in Michaelmas Term. There are three parts to this test: Reading Comprehension, Listening Comprehension, and Grammar. Candidates who have not studied or had contact with French for some time are advised to revise thoroughly, making use of the Language Centre’s French resources.

Students’ achievement will be assessed through a variety of means, including continuous assessment of oral performance, a written final examination, and a project or assignment chosen by individual students in consultation with their language tutor.

Reading comprehension, writing, listening comprehension and speaking are all examined. The oral component may consist of an interview, a presentation or a candidate’s performance in a formal debate or discussion.

Feedback Oral and written feedback from students are encouraged. A Feedback Form will be distributed at the end of each course.

6 Registration for Part B courses 2006–07

LECTURES AND CLASSES: Students will have to register in advance for the lectures and classes they wish to take. Students will have to register by Monday of Week 9 of Trinity Term 2006 using the form found at <https://www.maths.ox.ac.uk/current-students/undergraduates/forms/>. Students who register for a course or courses for which there is a quota will have to indicate a “reserve choice” which they will take if they do not receive a place on the course with the quota. They may also have to give the reasons why they wish to take a course which has a quota, and provide the name of a tutor who can provide a supporting statement for them should the quota be exceeded. In the event that the quota for a course is exceeded, the Mathematics Teaching Committee will decide who may have a place on the course on the basis of the supporting statements from the student and tutor. Students who are not allocated a place on the course with the quota will be registered for their “reserve” course. Students will be notified of this by email. In the case of the “Undergraduate Ambassadors’ Scheme” students will have to attend a short interview in Week 0, Michaelmas Term. In the meantime they will also have to complete a separate application form, and indicate a “reserve” course.

LECTURES: Some combinations of subjects are not advised and lectures may clash. Details are given below. We will use the information on your registration forms to aim to keep clashes to a minimum. However, because of the large number of options available in Part B some clashes are inevitable, and we must aim to accommodate the maximum number of student preferences.

Lecture Timetabling in Part B, 2006-7

The Teaching Committee has agreed that the following clashes be allowed.

Pure vs Applied

B1 Logic and Set Theory B2 Algebra B3 Geometry B9 Number Theory	may clash with	B6 Theoretical Mechanics B8 Topics in Applied Mathematics
--------------------------------------------------------------------------	----------------	--------------------------------------------------------------

Mathematics vs Statistics

B1 Logic and Set Theory B2 Algebra B3 Geometry B6 Theoretical Mechanics B7 Mathematical Physics B9 Number Theory All M-level options	may clash with	OBS1 Applied Statistics OBS3 Stochastic Modelling
B3 Geometry B6 Theoretical Mechanics B7 Mathematical Physics All M-level options	may clash with	OBS4 Actuarial Science
All Part B Maths and M-level options		OBS2 Statistical Inference

Mathematics vs Comp

B3 Geometry B6 Theoretical Mechanics B7 Mathematical Physics B8 Topics in Applied Mathematics All M-level options	may clash with	OCS1 Functional Programming and Data Structures and Algorithms
B1 Logic and Set Theory B2 Algebra B3 Geometry B7 Mathematical Physics B9 Number Theory All M-level options	may clash with	OB21 Numerical Solution of Differential Equations
B3 Geometry B7 Mathematical Physics All M-level options	may clash with	OB22 Integer Programming

Mathematics vs Philosophy

B5 Applied Analysis B6 Theoretical Mechanics B7 Mathematical Physics B8 Topics in Applied Mathematics B10 Martingales & Financial Mathematics B11 Communication Theory	may clash with	FHS Maths & Phil Core options
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------	-------------------------------

‘Other’ Mathematical and ‘Non-Mathematical’ subjects

OBS1 Applied Statistics	may clash with	OCS1 Functional Programming and Data Structures & Algorithms OB21 Numerical Solution of Differential Equations OB22 Integer Programming	may clash with	All papers in Philosophy
OBS2 Statistical Inference				
OBS3 Stochastic Modelling				
OBS4 Actuarial Science
