

# Digital Signature from zk-SNARK

Wei-Chih Hong @BTQ

With Ming-Shing Chen, Yu-Shian Chen, Chen-Mou Cheng, Shiu-an Fu, Jen-Hsuan Hsiang, Jimmy Hu, Po-Chun Kuo, Wei-Bin Lee, Feng-Hao Liu and Justin Thaler

# Why “preon”?

<https://pqshield.github.io/nist-sigs-zoo/wide.html>

# preon: beyond digital signature

- Standard digital signature on message  $x$  :
  - “I swear that the signer said  $x$ .”
- Beyond digital signature:
  - “The signer said  $x$ , which I'm not going to disclose here, but I swear that  $f(x) = y$ .”
  - Selective reveal
    - E.g. prove “I'm a citizen and more than 18 years old.” without revealing further information in one's digital ID

# preon: overview

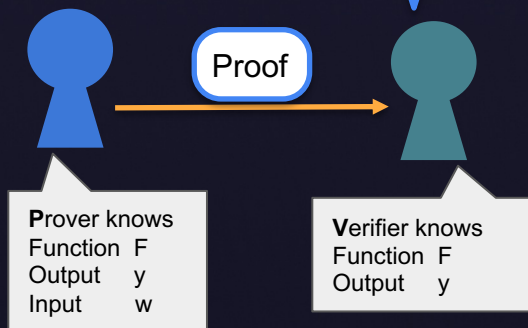

Provides the flexibility to prove any properties of msg

Provides the security to our signature

**zk-SNARK** + **OWF** => Signature scheme

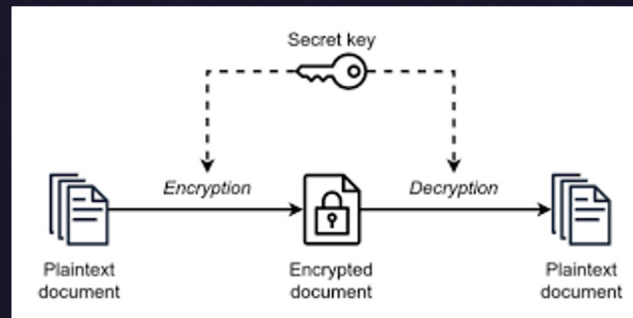

## Aurora

**Zero-Knowledge** Succinct Non-Interactive **AR**gument of **K**nowledge  
"I know  $w$  s.t.  $y = F(w)$ "

## AES

The most widely used symmetric cipher standard in the world

# preon: under the hood

- preon  $\approx$  Aurora + AES
  - Aurora: post-quantum zk-SNARK
  - AES as one-way function
    - Public key is a pair of ciphertext and plaintext encrypted under the private key
- Optimization: replace prime field with **binary field**
  - greatly reduced number of constraints
  - faster arithmetic, additive FFT
  - about 20% smaller signature

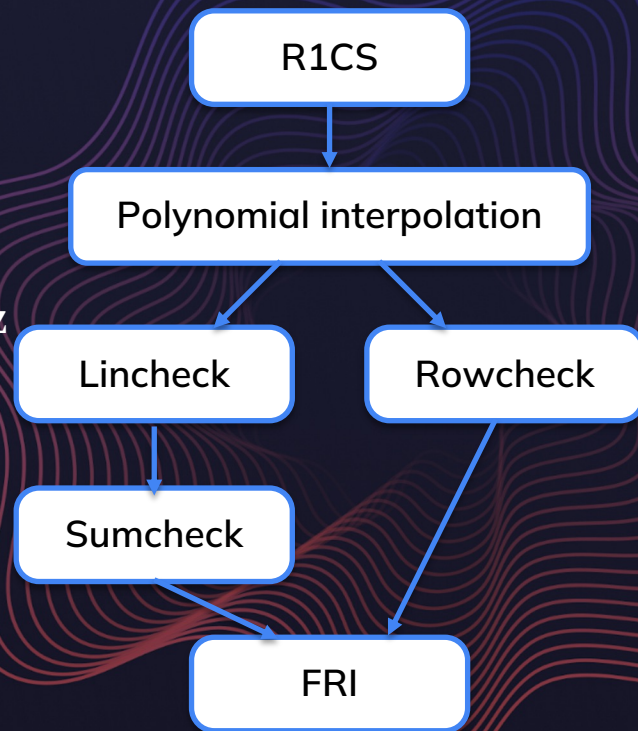

# zk-SNARK

## Zero-Knowledge Succinct Non-Interactive ARgument of Knowledge

- Prover  $P$  computes a proof  $\pi$  which convinces verifier  $V$  that  $P$  knows a  $\omega$  such that  $y = f(x, \omega)$ .
- $\pi$  is "small" compared with  $f$ , e.g.  $|\pi| = O(\log|f|)$

# Aurora

- Encode  $y = f(x, \omega)$  into R1CS:  $\mathbf{Az} \circ \mathbf{Bz} = \mathbf{Cz}$ , where
  - $\mathbf{A}, \mathbf{B}, \mathbf{C}$  are matrices depending on  $f$
  - $\mathbf{z} = [1, \mathbf{v}, \mathbf{w}]^T$
  - Lincheck RS-encoded IOP:  $\mathbf{a} = \mathbf{Az}, \mathbf{b} = \mathbf{Bz}, \mathbf{c} = \mathbf{Cz}$
  - Rowcheck RS-encoded IOP:  $\mathbf{a} \circ \mathbf{b} = \mathbf{c}$
  - FRI low degree test on a single random linear combination of the committed polynomials in lincheck and rowcheck
  - BCS transform to turn a public-coin IOP into a NIROP

# RS-encoded IOP

- Think of  $z \in V$  as a function  $H \rightarrow F_q$  for  $|H| = \dim V$
- Encode  $z$  as  $f_z$  via Lagrange interpolation
  - $f_z(X) = r(X) + s(X) \prod_{h \in H} (X - h)$ , such that  $\forall h \in H, r(h) = f_z(h)$
  - $s(X)$  is randomly sampled masking polynomial with bounded degree
- Verifier can now query  $f_z(x)$  for some  $x \in L$ 
  - Intuition: ZK if  $H \cap L = \emptyset$  and  $\deg s$  is large enough
- Run FRI to check if  $\deg f_z$  is small enough (low degree test)
- Example: for Preon128A,  $|H| = 2^{12}$ ,  $|L| = 2^{19}$ , FRI test for degree lower than  $2^{14}$

Part 1

$P(\mathbf{w}, \mathbf{v}, \mathbf{A}, \mathbf{B}, \mathbf{C})$

$V(\mathbf{v}, \mathbf{A}, \mathbf{B}, \mathbf{C})$

compute  $f_{\mathbf{w}}, f_{\mathbf{A}\mathbf{z}}, f_{\mathbf{B}\mathbf{z}}, f_{\mathbf{C}\mathbf{z}}$

$\hat{f}_{\mathbf{w}}, \hat{f}_{\mathbf{A}\mathbf{z}}, \hat{f}_{\mathbf{B}\mathbf{z}}, \hat{f}_{\mathbf{C}\mathbf{z}}$

Part 2, for indices  $i \in \{1, \dots, \lambda_i\}$ , do the following independently

$P$

$V$

sample  $\alpha_i, s_{i,1}, s_{i,2}, s_{i,3} \stackrel{\$}{\leftarrow} \mathbb{F}$

$\alpha_i, s_{i,1}, s_{i,2}, s_{i,3}$

compute  $g_i, h_i$   
from formula (10)

$\hat{h}_i$

Part 3, for indices  $j \in \{1, \dots, \lambda'_i\}$ , do the following independently

$P$

$V$

sample  $\mathbf{y}_j \xleftarrow{\$} \mathbb{F}^{5+3\lambda_i}$

$\longleftarrow \mathbf{y}_j$

$P$  and  $V$  run an FRI protocol for  
 $\deg(f_{j,0}) < 2 \max\{m, n + 1\}$   
 where  $f_{j,0}$  is defined by formula (11)

$\longrightarrow$

$$f_{j,0} := \mathbf{y}_{j,1} \cdot f_{\mathbf{w}} + \mathbf{y}_{j,2} \cdot f_{\mathbf{Az}} + \mathbf{y}_{j,3} \cdot f_{\mathbf{Bz}} + \mathbf{y}_{j,4} \cdot f_{\mathbf{Cz}} + \mathbf{y}_{j,5} \cdot \frac{f_{\mathbf{Az}} \cdot f_{\mathbf{Bz}} - f_{\mathbf{Cz}}}{Z_{H_1}}$$

$$+ \sum_{i=1}^{\lambda_i} (\mathbf{y}_{j,5+i} \cdot h_i) + \sum_{i=1}^{\lambda_i} (\mathbf{y}_{j,5+\lambda_i+i} \cdot g_i)$$

$$+ \sum_{i=1}^{\lambda_i} (\mathbf{y}_{j,5+2\lambda_i+i} \cdot X^{(2 \max\{m, n+1\}) - (\max\{m, n+1\} - 1)} \cdot g_i)$$

# Expressiveness of R1CS

$y = x^3$	$x \cdot x = y$ $u \cdot x = y$
$0 \leq x < 8$	$1 \cdot (x_0 + 2x_1 + 4x_2) = x$ $x_0 \cdot x_0 = x_0$ $x_1 \cdot x_1 = x_1$ $x_2 \cdot x_2 = x_2$
$r = \text{if } b \text{ then } t \text{ else } f$	$(t - f) \cdot b = r - f$ $b \cdot b = b$

# R1CS constraints for AES

- Every byte variable in AES is a field element in  $\mathbb{F}_2[x]/(x^8+x^4+x^3+x+1)$
- Adopting binary field in Aurora makes expressing AES encryption as R1CS constraints extremely efficient.
  - E.g. the inversion of a field element in the SubBytes step
  - $y = b^{-1} \bmod (x^8+x^4+x^3+x+1) \Leftrightarrow b \times y = 1 + h \times (x^8+x^4+x^3+x+1)$  with additional range check constraints on the bits of  $y$  and  $h$
- Total number of constraints for AES-128: **14240**<sup>†</sup> → **3656**
  - Greatly reduces the size of matrices A, B, C

<sup>†</sup><https://github.com/akosba/xjsnark>

# Parameter selection

- Three sets of parameters, namely aggressive (A), balanced (B), and conservative (C), are selected for security level 1, 3, and 5.
- Only the **aggressive** and **balanced** parameter sets are recommended

Parameter set	$ \mathbb{F} $	$t$	$ \mathbb{L} $	$b$	$\ell$	$\lambda$
Preon128A	$2^{192}$	$2^{12}$	$2^{19}$	1040	26	256
Preon128B	$2^{192}$	$2^{12}$	$2^{19}$	2320	58	384
Preon192A	$2^{256}$	$2^{13}$	$2^{20}$	1638	39	384
Preon192B	$2^{256}$	$2^{13}$	$2^{20}$	3654	87	512
Preon256A	$2^{320}$	$2^{14}$	$2^{20}$	2184	52	512
Preon256B	$2^{320}$	$2^{14}$	$2^{20}$	4956	118	512

# preon: performance

Security	Size (Bytes)			Timing		
	Private key	Public key	Signature	Keygen	Sign	Verify
128-bit(A)	16	32	139K	2us	7s	209ms
128-bit(B)	16	32	372K	2us	7.3s	224ms
192-bit(A)	24	56	312K	2us	24.3s	1,867ms
192-bit(B)	24	56	778K	2us	25.6s	1,847ms
256-bit(A)	32	64	598K	2us	80.6s	8,724ms
256-bit(B)	32	64	1,157K	2us	80.2s	8,528ms

# Summary of current results

- Can be easily extended to support advanced functions with R1CS
- Preliminary security analysis shows even Aggressive (A) meets NIST's requirement, with Balanced (B) as backup
- Small public/private keys but big signatures
- Current implementation is slow

# Future directions

- In-depth security analysis and proofs
  - Working with experts on zk-SNARK
- Further optimized implementations
  - In progress on optimized CPU implementation
  - FPGA implementation
  - Open: GPU implementation
- Preon+ (Cantor basis + efficient R1CS encode)

Security	Private key	Public key	Signature	Keygen	Sign	Verify
Preon128-bit(A)	16	32	139KB	2us	7s	209ms
<b>Preon+128-bit(A)</b>	<b>16</b>	<b>32</b>	<b>125 -&gt; 90KB</b>	<b>2us</b>	<b>628 ms</b>	<b>197 ms</b>
