1 Foreword

Notice of misprints or errors of any kind, and suggestions for improvements in this booklet should be addressed to the Academic Assistant in the Mathematical Institute.

[See the current edition of the *Examination Regulations* for the full regulations governing these examinations.]

In Part A each candidate shall be required to offer the 3 written papers in Mathematics from the schedule of papers for Part A (given below). Each paper will be $2\frac{1}{4}$ hours, and the three papers taken together will be counted as equivalent to two 3 hour papers.

At the end of the Part A examination, a candidate will be awarded a 'University Standardised Mark' (USM) for each paper in Part A Mathematics. The three USMs will be carried forward into the classification awarded at the end of the third year. In the calculation of any averages used for the final classification, the three USMs will be scaled by $\frac{2}{3}$ so as to give the equivalent of two papers.

The Schedule of Papers

Paper AC1(P) Algebra and Analysis

This paper will contain 6 short questions set on the CORE material in Algebra and Analysis for Part A of the FHS of Mathematics. Candidates are expected to answer all 6 questions.

Paper AC2(P) Algebra and Analysis

This paper will contain 6 longer questions set on the CORE material in Algebra and Analysis for Part A of the FHS of Mathematics.

Paper AO3(P) Options

This paper will contain questions on the OPTIONAL subjects drawn from Part A of the FHS of Mathematics and listed below. These will also be longer questions. Candidates may submit up to 4 answers, and the best 3 will count. There will be 1 question for each 8 lectures.

OPTIONAL SUBJECTS

Groups in Action

Introduction to Fields

Number Theory

Integration

Topology

Multivariable Calculus

Candidates may also, with the support of their College tutors, apply to the Joint Committee for Mathematics and Philosophy for approval of other Optional Subjects as listed for Part

A of the Honour School of Mathematics. Such an application should be made through the candidate's college and sent to the Chairman, Joint Committee for Mathematics & Philosophy, c/o Academic Administrator, Mathematical Institute to arrive by 5 pm on Friday of Week 3 of Michaelmas Term.

Syllabus and Synopses

The **syllabus** details in this booklet are those referred to in the *Examination Regulations* and have been approved by the Subfaculty Teaching Committee for examination in Trinity Term 2006.

The **synopses** in this booklet give some additional detail, and show how the material is split between the different lecture courses. They also include details of recommended reading.

September 2006

2 CORE MATERIAL

2.1 Syllabus

2.1.1 Algebra

Vector spaces over an arbitrary field, subspaces, direct sums; projection maps and their characterisation as idempotent operators.

Dual spaces of finite-dimensional spaces; annihilators; the natural isomorphism between a space and its second dual; dual transformations and their matrix representation with respect to dual bases.

Some theory of a single linear transformation on a finite-dimensional space: characteristic polynomial, minimal polynomial, Primary Decomposition Theorem, the Cayley–Hamilton theorem; diagonalisability; triangular form.

Real and complex inner product spaces. Orthogonal complements, orthonormal sets; the Gram–Schmidt process. Bessel’s inequality; the Cauchy–Schwarz inequality.

The adjoint of a linear transformation on a finite-dimensional inner product space to itself. Eigenvalues and diagonalisability of self-adjoint linear transformations.

Commutative rings with unity, integral domains, fields; units, irreducible elements, primes.

Ideals and quotient rings; isomorphism theorems. The Chinese Remainder Theorem [classical case of \mathbb{Z} only].

Maximal ideals and their quotient rings.

Euclidean rings and their properties: polynomial rings as examples, theorem that their ideals are principal; theorem that their irreducible elements are prime; uniqueness of factorisation.

The Gaussian integers.

2.1.2 Analysis

The topology of Euclidean space and its subsets, particularly \mathbb{R} , \mathbb{R}^2 , \mathbb{R}^3 : open sets, closed sets, subspace topology; continuous functions and their characterisation in terms of pre-images of open or closed sets; connected sets, path-connected sets; compact sets, Heine–Borel Theorem.

The algebra and geometry of the complex plane. Complex differentiation. Holomorphic functions. Cauchy–Riemann equations (including z , \bar{z} version). Real and imaginary parts of a holomorphic function are harmonic.

Path integration. Fundamental Theorem of Calculus in the path integral/holomorphic function setting. Power series and differentiation of power series. Exponential function, logarithm function, fractional powers - examples of multifunctions.

Cauchy’s Theorem (proof excluded). Cauchy’s Integral formulae. Taylor expansion. Liouville’s Theorem. Identity Theorem. Morera’s Theorem. Laurent’s expansion. Classification of singularities. Calculation of principal parts and residues. Residue theorem. Evaluation of integrals by the method of residues (straight forward examples only but to include use

of Jordan's lemma and simple poles on contour of integration).

Conformal mapping: Möbius functions, exponential functions, fractional powers; mapping regions (not Christoffel transformations or Jowkowski's transformation).

2.2 Synopses of Lectures

2.2.1 Algebra — Dr Neumann — 24 lectures MT

Rings and arithmetic [8 lectures, Michaelmas Term]

Aims and Objectives

This half-course introduces the student to some classic ring theory which is basic for other parts of abstract algebra, for linear algebra and for those parts of number theory that lead ultimately to applications in cryptography. The first-year algebra course contains a treatment of the Euclidean Algorithm in its classical forms for integers and for polynomial rings over a field. Here the idea is developed *in abstracto*. The Gaussian integers, which have applications to many questions of elementary number theory, give an important and interesting (and entertaining) illustration of the theory.

Synopsis

Commutative rings with unity, integral domains, fields; examples including polynomial rings and subrings of \mathbb{R} and \mathbb{C} .

Ideals and quotient rings; isomorphism theorems. Examples: integers modulo a natural number; the Chinese Remainder Theorem; the quotient ring by a maximal ideal is a field.

Arithmetic in integral domains. Units, associates, irreducible elements, primes. Euclidean rings and their properties: Division Algorithm, Euclidean Algorithm; \mathbb{Z} and $F[x]$ as prototypes. Properties of euclidean rings: their ideals are principal; their irreducible elements are prime; factorisation is unique.

Examples for applications: Gauss's Lemma and factorisation in $\mathbb{Q}[x]$; factorisation of Gaussian integers.

Reading

Peter J Cameron, *Introduction to Algebra*, OUP 1998, ISBN 0-19-850194-3. Chapter 2.

Alternative and further reading:

I N HERSTEIN, *Topics in Algebra* (Second edition) Wiley 1975, ISBN 0-471-02371-X. Chapter 3. [Harder than some, but an excellent classic. Widely available in Oxford libraries; still in print.]

P M COHN, *Classic Algebra*, Wiley 2000, ISBN 0-471-87732-8. Various sections. [This is the third edition of his book previously called *Algebra I*.]

DAVID SHARPE, *Rings and Factorization*, CUP 1987, ISBN 0-521-33718-6. [An excellent little book, now sadly out of print; available in some libraries, though.]

There are very many other such books on abstract algebra in Oxford libraries.

Further Linear Algebra [16 lectures in Michaelmas Term]

Aims and Objectives

The core of linear algebra comprises the theory of linear equations in many variables, the theory of matrices and determinants, and the theory of vector spaces and linear transformations. All these topics were introduced in the Moderations course. Here they are developed further to provide the tools for applications in geometry, modern mechanics and theoretical physics, probability and statistics, functional analysis and, of course, algebra and number theory. Our aim is to provide a thorough treatment of some classical theory that describes the behaviour of linear transformations on a finite-dimensional vector space to itself, both in the purely algebraic setting and in the situation where the vector space carries a metric deriving from an inner product.

Synopsis

Fields; \mathbb{Q} , \mathbb{R} , \mathbb{C} , \mathbb{F}_p as examples. Vector spaces over an arbitrary field, subspaces, direct sums; projection maps and their characterisation as idempotent operators.

Dual spaces of finite-dimensional spaces; annihilators; the natural isomorphism between a finite-dimensional space and its second dual; dual transformations and their matrix representation with respect to dual bases.

Some theory of a single linear transformation on a finite-dimensional space: characteristic polynomial, minimal polynomial, Primary Decomposition Theorem, the Cayley–Hamilton theorem (economically); diagonalisability; triangular form.

Real and complex inner product spaces: examples, including function spaces [but excluding completeness and L^2]. Orthogonal complements, orthonormal sets; the Gram–Schmidt process. Bessel’s inequality; the Cauchy–Schwarz inequality.

Some theory of a single linear transformation on a finite-dimensional inner product space: the adjoint; eigenvalues and diagonalisability of a self-adjoint linear transformation.

Reading

Richard Kaye and Robert Wilson, *Linear Algebra*, OUP 1998, ISBN 0-19-850237-0. Chapters 2–13. [Chapters 6, 7 are not entirely relevant to our syllabus, but are interesting.]

2.2.2 Analysis — Dr Luke — 24 lectures MT

Aims and Objectives

The theory of functions of a complex variable is a rewarding branch of mathematics to study at the undergraduate level with a good balance between general theory and examples. It occupies a central position in mathematics with links to analysis, algebra, number theory, potential theory, geometry, topology, and generates a number of powerful techniques (for example, evaluation of integrals) with applications in many aspects of both pure and applied mathematics, and other disciplines, particularly the physical sciences.

In these lectures we begin by introducing students to the language of topology before using it in the exposition of the theory of (holomorphic) functions of a complex variable. The central aim of the lectures is to present Cauchy's theorem and its consequences, particularly series expansions of holomorphic functions, the calculus of residues and its applications.

The course concludes with an account of the conformal properties of holomorphic functions and applications to mapping regions.

Synopsis

(1-4) Topology of Euclidean space and its subsets, particularly \mathbb{R} , \mathbb{R}^2 , \mathbb{R}^3 . Open sets, closed sets, subspace topology; continuous functions and their characterisation in terms of preimages of open or closed sets; connected sets, path-connected sets; compact sets, Heine-Borel Theorem (covered in Chapter 3 of Apostol).

(5-7) Review of algebra and geometry of the complex plane. Complex differentiation. Holomorphic functions. Cauchy-Riemann equations. Real and imaginary parts of a holomorphic function are harmonic.

(8-11) Path integration. Power series and differentiation of power series. Exponential function and logarithm function. Fractional powers - examples of multifunctions.

(12-13) Cauchy's Theorem. (Sketch of proof only -students referred to various texts for proof) Fundamental Theorem of Calculus in the path integral/holomorphic situation.

(14-16) Cauchy's Integral formulae. Taylor expansion. Liouville's Theorem. Identity The-

orem. Morera's Theorem

(17-18) Laurent's expansion. Classification of singularities. Calculation of principal parts, particularly residues.

(19-21) Residue theorem. Evaluation of integrals by the method of residues (straight forward examples only but to include use of Jordan's lemma and simple poles on contour of integration).

(22-23) Conformal mapping: Möbius functions, exponential functions, fractional powers; mapping regions (not Christoffel transformations or Jowkowski's transformation).

(24) Summary and Conclusion.

3 OPTIONS

3.1 Syllabus

3.1.1 Groups in Action

Groups: subgroups, normal subgroups and quotient groups; elementary results concerning symmetric and alternating groups; important examples of groups. Actions of groups on sets; examples, including coset spaces, groups acting on themselves by conjugation, the Möbius group acting on the Riemann sphere. Permutation representations; the permutation representation associated with a coset space; examples. Orbits, transitivity, stabilisers, isomorphism of a transitive space with a coset space, examples. Symmetry groups of geometric objects including regular polyhedra. Combinatorial applications: “Not Burnside’s Lemma” and its use in enumeration problems.

3.1.2 Introduction to Fields

Fields, subfields, finite extensions; examples. Degree of an extension, the Tower Theorem. Simple algebraic extensions; splitting fields, uniqueness (proof not to be examined); examples. Characteristic of a field. Finite fields: existence; uniqueness (proof not to be examined). Subfields. The multiplicative group of a finite field. The discrete logarithm.

3.1.3 Number Theory

The ring of integers; congruences; rings of integers modulo n ; the Chinese Remainder Theorem. Wilson’s Theorem; Fermat’s Little Theorem for prime modulus. Euler’s phi-function; Euler’s generalisation of Fermat’s Little Theorem to arbitrary modulus. Quadratic residues modulo primes. Quadratic reciprocity. Factorisation of large integers; basic version of the RSA encryption method.

3.1.4 Integration

The Lebesgue integral on the real line, null sets, reconciliation with the integral introduced in Moderations. [Details of technical results on the construction of the integral are not examinable.] Properties of the Lebesgue integral. Simple examples of non-integrable functions.

The Monotone Convergence Theorem [proof not examinable] and the deduction of the Dominated Convergence Theorem. Integrability of x^a , e^{-x} and e^{-x^2} over suitable intervals; simple form of comparison theorem for integrability. Term-by-term integration of a series including Lebesgue’s Series Theorem.

The Dominated Convergence Theorem with a continuous parameter; examples of continuity and differentiation of functions defined by integrals.

Simple examples of improper integrals. Integrals of complex-valued functions. Measurable functions (defined as limits a.e. of sequences of step functions); comparison theorem for integrability. Measurable sets and Lebesgue measure, including countable additivity.

Outline development of the Lebesgue integral on \mathbb{R}^2 . The theorems of Fubini and Tonelli (proof of technical lemma on null sets is not examinable). Convolution of integrable functions. Simple form of change of variables theorem (no proof). Examples.

L^p -spaces as vector spaces. [Completeness and proofs of Hölder's inequality and Minkowski's inequality for general p are not examinable.]

3.1.5 Topology

Metric spaces. Examples to include metrics derived from a norm on a real vector space, particularly l^1 , l^2 , l^∞ norms on \mathbb{R}^n , the *sup* norm on the bounded real-valued functions on a set, and on the bounded continuous real-valued functions on a metric space. Continuous functions (ϵ, δ definition). Uniformly continuous functions. Open balls, open sets, accumulation points of a set. Completeness (but not completion). Contraction mapping theorem. Completeness of the space of bounded real-valued functions on a set, equipped with the *sup* norm, and the completeness of the space of bounded continuous real-valued functions on a metric space, equipped with the *sup* metric.

Axiomatic definition of an abstract topological space in terms of open sets. Continuous functions, homeomorphisms. Closed sets. Accumulation points of sets. Closure of a set ($\bar{A} = A$ together with its accumulation points). Continuity if $f(\bar{A}) \subseteq \overline{f(A)}$. Examples to include metric spaces (definition of topological equivalence of metric spaces), discrete and indiscrete topologies, subspace topology, cofinite topology, quotient topology. Base of a topology. Product topology on a product of two spaces and continuity of projections. Hausdorff topology.

Connected spaces: closure of a connected space is connected, union of connected sets is connected if there is a non-empty intersection, continuous image of a connected space is connected. Path-connectedness implies connectedness. Connected open subset of a normed vector space is path-connected.

Compact sets, closed subset of a compact set is compact, compact subset of a Hausdorff space is closed. Heine-Borel Theorem in \mathbb{R}^n . Product of two compact spaces is compact. A continuous bijection from a compact space to a Hausdorff space is a homeomorphism. Equivalence of sequential compactness and abstract compactness in metric spaces.

Further discussion of quotient spaces: simple classical geometric spaces such as the torus and Klein bottle.

3.1.6 Multivariable Calculus

Definition of a derivative of a function from \mathbb{R}^m to \mathbb{R}^n ; examples; elementary properties; partial derivatives; the chain rule; the gradient of a function from \mathbb{R}^m to \mathbb{R} ; Jacobian. Continuous partial derivatives imply differentiability. Higher order derivatives; symmetry of multiple partial derivatives.

The inverse function theorem (proof non-examinable). The implicit function theorem (statement only).

The definition of a submanifold of \mathbb{R}^m , its tangent space at a point. Examples, defined parametrically and implicitly, including curves and surfaces in \mathbb{R}^3 , and $SO(n)$.

Lagrange multipliers.

3.2 Synopses of Lectures

3.2.1 Groups in Action — Dr M Collins — 8 lectures HT

Aims and Objectives

The beginnings of the theory of groups were presented in the Moderations course in algebra. Here we develop that theory, aiming particularly to show how it is used in the measurement of symmetry, what symmetry is and how to show it may be measured is relatively easy to understand in geometrical contexts. But it is important in most other parts of mathematics, in much of physics and chemistry, and in many other areas. Our aim in this half unit is to introduce the theory of actions of groups and show how it may be applied in the measurement of symmetry.

Synopsis

Reminders about groups, subgroups, normal subgroups and quotient groups; reminders about the symmetric and alternating groups; important examples of groups. [1 lecture]

Actions of groups on sets; examples including coset spaces, groups acting on themselves by conjugation, the Möbius group acting on the Riemann sphere. [1 lecture]

Permutation representations; the permutation representation associated with a coset space; examples. [2 lectures]

Orbits, transitivity, stabilisers, isomorphism of a transitive space with a coset space, examples. [2 lectures]

Symmetry groups of geometric objects including regular polyhedra. Combinatorial applications: “Not Burnside’s Lemma” and its use in enumeration problems. [2 lectures]

Reading

3.2.2 Introduction to Fields — Dr M Collins — 8 lectures HT

Aims and Objectives

Informally, finite fields are generalisations of systems of real numbers such as the rational or the real numbers— systems in which the usual rules of arithmetic (including those for division) apply. Formally, fields are commutative rings with unity in which division by non-zero elements is always possible. It is a remarkable fact that the finite fields may be completely classified. Furthermore, they have classical applications in number theory, algebra, geometry, combinatorics, and coding theory, and they have newer applications in other areas. The aim of this course is to show how their structure may be elucidated, and to present the main theorems about them that lead to their various applications.

Synopsis

Fields, subfields, finite extensions; examples. Degree of an extension, the Tower Theorem. [2 lectures]

Simple algebraic extensions; splitting fields, uniqueness (proof only sketched); examples. [2 lectures]

Characteristic of a field. Finite fields: existence; uniqueness (proof only sketched). Subfields. The multiplicative group of a finite field. The discrete logarithm. [4 lectures]

Reading

Joseph J Rotman, *A First Course in Abstract Algebra*, (Second Edition, Prentice Hall, 2000), ISBN 0-13-011584-3. Chapters 1,3.

P M Cohn, *Classic Algebra*, (Wiley 2000), ISBN 0-471-87732-8, parts of Chapter 6. [This is the third edition of his book on abstract algebra, in Oxford libraries.]

There are many other such books on abstract algebra in Oxford libraries

3.2.3 Number Theory — Prof Heath-Brown — 8 lectures TT

Aims and Objectives

Number theory is one of the oldest parts of mathematics. For well over two thousand years it has attracted professional and amateur mathematicians alike. Although notoriously ‘pure’ it has turned out to have more and more applications as new subjects and new technologies have developed. Our aim in this course is to introduce students to some classical and important basic ideas of the subject.

Synopsis

The ring of integers; congruences; rings of integers modulo u ; the Chinese Remainder Theorem. [2 lectures]

Wilson's Theorem; Fermat's Little Theorem for prime modulus; Euler's generalization of Fermat's Little Theorem to arbitrary modulus; primitive roots.[2 lectures]

Quadratic residues modulo primes. Quadratic reciprocity. [2 lectures]

Factorisation of large integers; basic version of the RSA encryption method. [2 lectures]

Reading

Alan Baker, *A Concise Introduction to the Theory of Numbers*, Cambridge University Press ISBN: 0521286549 Chapters 1,3,4

David Burton, *Elementary Number Theory*, (McGraw-Hill, 2001).

Dominic Welsh, *Codes and Cryptography*, Oxford University Press 1988, ISBN 0-19853-287-3. Chapter 11

3.2.4 Integration — Dr Vincent-Smith — 16 lectures HT

Aims and Objectives

A naive integral was introduced in the Moderations syllabus. For more advanced applications where functions are not continuous and limiting processes are involved, a more advanced integral is needed. The aim of this course is to introduce students to the Lebesgue integral, its properties and applications. This facilitates the understanding of integration on the more abstract spaces that underpin probability theory.

This option is good preparation for later units on mathematical analysis, functional analysis, differential equations, applied analysis, probability theory and many applied mathematics topics.

Synopsis

The Lebesgue integral on the real line, null sets, reconciliation with the integral introduced in Moderations. [Details of technical results on the construction of the integral are not examinable.] Properties of the Lebesgue integral. Simple examples of non-integrable functions.

The Monotone Convergence Theorem [proof not examinable] and the deduction of the Dominated Convergence Theorem. Integrability of x^a , e^{-x} and e^{-x^2} over suitable intervals; simple form of comparison theorem for integrability. Term-by-term integration of a series including Lebesgue's Series Theorem.

The Dominated Convergence Theorem with a continuous parameter; examples of continuity and differentiation of functions defined by integrals.

Simple examples of improper integrals. Integrals of complex-valued functions. Measurable functions (defined as limits a.e. of sequences of step functions); comparison theorem for integrability. Measurable sets and Lebesgue measure, including countable additivity.

Outline development of the Lebesgue integral on \mathbb{R}^2 . The theorems of Fubini and Tonelli (proof of technical lemma on null sets is not examinable). Convolution of integrable functions. Simple form of change of variables theorem (no proof). Examples.

L^p -spaces as vector spaces. [Proofs of Hölder's inequality and Minkowski's inequality for general p , and completeness are not examinable.]

Reading

H Priestley, *Introduction to Integration*, Oxford Science Publications, 1997, Chapters 1-28.

3.2.5 Topology — Dr Sutherland — 16 lectures HT

Learning Outcomes

The ideas, concepts and constructions in general topology arose from extending the notions of continuity and convergence on the real line to more general spaces. The first class of general spaces to be studied in this way were metric spaces, a class of spaces which includes many of the spaces used in analysis and geometry. Metric spaces have a distance function which allows the use of geometric intuition and gives them a concrete feel. They allow us to introduce much of the vocabulary used later and to understand the formulation of continuity which motivates the axioms in the definition of an abstract topological space.

The axiomatic formulation of a topology leads to topological proofs of simplicity and clarity often improving on those given for metric spaces using the metric and sequences. There are many examples of topological spaces which do not admit metrics and it is an indication of the naturality of the axioms that the theory has found so many applications in other branches of mathematics and spheres in which mathematical language is used.

The outcome of the course is that a student should understand and appreciate the central results of general topology and metric spaces, sufficient for the main applications in geometry, number theory, analysis and mathematical physics, for example.

Synopsis

Metric spaces. Examples to include metrics derived from a norm on a real vector space, particularly l^1 , l^2 , l^∞ norms on \mathbb{R}^n , the *sup* norm on the bounded real-valued functions on a set, and on the bounded continuous real-valued functions on a metric space. Continuous functions (ϵ, δ definition). Uniformly continuous functions. Open balls, open sets, accumulation points of a set. Completeness (but not completion). Contraction mapping theorem. Completeness of the space of bounded real-valued functions on a set, equipped with the *sup* norm, and the completeness of the space of bounded continuous real-valued functions on a metric space, equipped with the *sup* metric. [3 lectures].

Axiomatic definition of an abstract topological space in terms of open sets. Continuous

functions, homeomorphisms. Closed sets. Accumulation points of sets. Closure of a set ($\bar{A} = A$ together with its accumulation points). Continuity if $f(\bar{A}) \subseteq \overline{f(A)}$. Examples to include metric spaces (definition of topological equivalence of metric spaces), discrete and indiscrete topologies, subspace topology, cofinite topology, quotient topology. Base of a topology. Product topology on a product of two spaces and continuity of projections. Hausdorff topology. [5 lectures]

Connected spaces: closure of a connected space is connected, union of connected sets is connected if there is a non-empty intersection, continuous image of a connected space is connected. Path-connectedness implies connectedness. Connected open subset of a normed vector space is path-connected. [2 lectures]

Compact sets, closed subset of a compact set is compact, compact subset of a Hausdorff space is closed. Heine-Borel Theorem in \mathbb{R}^n . Product of two compact spaces is compact. A continuous bijection from a compact space to a Hausdorff space is a homeomorphism. Equivalence of sequential compactness and abstract compactness in metric spaces. [4 lectures]

Further discussion of quotient spaces explaining some simple classical geometric spaces such as the torus and Klein bottle. [2 lectures]

3.2.6 Multivariable Calculus — Dr Day — 8 lectures TT

Aims and Objectives

In this course, the notion of a derivative for a function $f: \mathbb{R}^m \rightarrow \mathbb{R}^n$ is introduced. Roughly speaking, this is an approximation of the function near each point in \mathbb{R}^n by a linear transformation. This is a key concept which pervades much of mathematics, both pure and applied, but is particularly important in geometry.

Synopsis

Definition of a derivative of a function from \mathbb{R}^m to \mathbb{R}^n ; examples; elementary properties; partial derivatives; the chain rule; the gradient of a function from \mathbb{R}^m to \mathbb{R} ; Jacobian. Continuous partial derivatives imply differentiability. Higher order derivatives; symmetry of multiple partial derivatives. [3 lectures]

The inverse function theorem (proof non-examinable), via the contraction mapping theorem. The implicit function theorem (statement only) [2 lectures]

The definition of a submanifold of \mathbb{R}^m . Its tangent space at a point. Examples, defined parametrically and implicitly, including curves and surfaces in \mathbb{R}^3 , and $SO(n)$. [2 lectures]

Lagrange multipliers. [1 lecture]
